B. Course on Building Construction and Drawing.—The first purpose of this course is to provide opportunities for the study of building construction with special regard to the function of workmanship and materials in good design. The normal sequence of trades will be followed, and simple problems in design will be carried out by the teachers in illustration of the principles elucidated.

C. Course for Teachers of Painting and Decorating.—This course is arranged for actual or intending teachers of painting and decorating. It will include lectures, demonstrations and practical work relating to design, ornament and the use of colour in decoration.

Full details are given on Form 105e. U., obtainable from the Board of Education, Whitehall, S.W.1.

The Building Strike in Glasgow.

After a prolonged conference, in which the Ministry of Labour was concerned, the building strike in Glasgow and the West of Scotland was settled on Saturday night. The dispute was caused by an intimation by the employers of a reduction in the labourers' wages. The settlement was arrived at on the basis that the Industrial Court should be asked to give its opinion whether the national building agreement should apply to the building trade labourers employed by members of the Scottish Building Contractors' Association of Glasgow and the West of Scotland, who were enforcing the reduction. About 5,000 men were involved in the strike.

Obituary.

The death has occurred at Bovey Tracey of Mr. Mark Henry Nichols, builder, of Orchard terrace.

SWAN & EDGAR'S AND THE BUILDING ACT

THE position with regard to Messrs. Swan & Edgar's, we are informed upon good authority, is as follows: The new building being in part in Regent-street, it was compulsory, under the terms of the Crown lease, to build to the height of 100 ft. above street level, in conformity with the rest of Regent-street. Under the London Building Act, 1894, no floor over 80 ft. from street level of the warehouse type—under which category the Swan & Edgar structure falls—may be occupied, if the cubical capacity of any cell of the building is over 250,000 cubic ft. This regulation is laid down with the question of fire in mind and the difficulty of attack in event of fire breaking out. The whole of the building under 80 ft. could, we believe, have been built in wood, and yet have conformed to the Act. The cubic area of Swan & Edgar's top story is larger than the Council thinks fit without a party wall or other corresponding structural alteration, and as the firm is of the opinion that such a step as the introduction of party walls, which would have to be carried right through from the basement, would have the effect of dividing the floor space of all departments into compartments, the idea of which is contrary to all modern tenets of a business, the matter has reached a deadlock. The firm wrote in December last to the Council pointing out that important modifications had been made to the scheme originally submitted to the Council, by which the extent of the cube in the lower section of the building had been greatly reduced, that the open staircases indicated had been replaced by staircases which were entirely enclosed, that all floors were entirely separated by imperforate floors (except the ground and mezzanine floors which were connected by a well-hole), that the whole of the roof was constructed of fire-proof materials, and that the structure in the event of fire could be attacked from four sides at once. It was further pointed out that the building was fitted with all modern fire appliances, that the lighting was electric, and lastly that the top floor would not be used by the public but by the firm as workrooms and counting-house.

The Council, however, possibly in view of the fact that similar permission to build, or at least to use, floor space over the 80 ft. limit, has already been refused to other firms in London, have not departed from their decision. Their action by making this decision is the more noticeable in view of the report of Mr. Topham Forrest, architect to the L.C.C., on the construction and control of buildings in the United States (published in *The Builder* for May 29, 1925). His recommendations to the Council, dealing with the application of special height limits to excess-of-cube buildings, contained the following:—

"During my visit to America, I found that no distinction was made between the height to which buildings could be erected and the height to which they could be used. Efficient fire protection appears to have been provided in New York to a height of 120 ft. for example, and it seems to me to be only a matter for engineering consideration to ensure that buildings in London should be so equipped that the fire risk could be controlled in excess-of-cube buildings erected even to the maximum height permitted by the Building Acts, plus the extra story to which I have already referred."

The practice of the Council (the L.C.C.) is to require that the maximum height of any excess-of-cube building shall not exceed 80 ft. to the ceiling of the topmost story.

The question that has been raised by this Swan & Edgar building is one which affects architects very considerably. If buildings cannot, because of out-of-date regulations, it is alleged, be built to fulfil their purpose economically and to their full extent, then the great business houses will be forced to lay aside plans of rebuilding premises, a great loss to trade generally and to the architect and constructor in particular. What is wanted is a revised Building Act based upon the requirements and conditions of modern business.

NEW BUILDINGS IN LONDON

Acton.—EXCHANGE.—His Majesty's Office of Works are proposing to erect a telephone exchange at the corner of Lexden-road and Barlow-road, Acton.

Aldwych.—PREMISES.—The Legislative Assembly at Delhi has voted a provision of £60,000 towards the construction of an India House for London, on a site adjoining Bush House in Aldwych. The total cost is estimated at about £300,000 initial, and £15,600 recurring. The new site is on land belonging to the L.C.C., and has its main frontage on Aldwych with a return frontage on Montreal-place connecting Aldwych with the Strand. The area is approximately 12,440 square feet. Provisional plans for the buildings have been prepared by Sir Herbert Baker, A.R.A., architect. The building will comprise one sub-basement, a basement, ground floor, and six upper floors, including an attic floor above the cornice.

Becontree.—HALL.—The London County Council are selling a site in Becontree-avenue to the Salvation Army for the erection of a hall.

Church-street.—PREMISES.—On a site next to the Gas Light & Coke Co.'s premises, in Church-street, Kensington, the Canonbury Construction Co., Ltd., are erecting new premises to the plans prepared by Messrs. Yates, Cook & Darbyshire, architects, of 45, Great Marlborough-street, W. 1.

Croydon.—HOUSES.—Mr. W. Ashton, Dixon-road, Croydon, has received sanction from the Croydon Council to the plans submitted by him for the erection of 179 houses and 13 garages in Dixon-road, Elm Park-road, and Whitehouse-lane.

Dufours-place.—ENLARGEMENT.—A site at Nos. 7–10, Dufours-place has been purchased by the Westminster City Council for the enlarging of the Marshall-street public baths and washhouses. No building contract has yet been let.

Ealing.—EXTENSIONS.—Mr. G. H. Fellowes-Prynne, F.R.I.B.A., architect, 6, Queen Anne's-gate, S.W. 1, has prepared plans for the extension to the Ealing Town Hall, in the Broadway, for the Town Council.

Holborn. — REBUILDING. — Messrs. Thomas Wallis, of Holborn, are rebuilding their store. One of the many up-to-date features will be a roof garden restaurant capable of seating over 1,000 people. Messrs. Yates, Sturdy & Usher are the architects; and Messrs. Woodward & Co. are the builders.

Latimer-road.—REBUILDING.—Messrs. Humphreys, builders, of Knightsbridge, S.W. 1, are rebuilding premises after fire in Latimer-road, North Kensington, W. 10. Mr. C. F. Short, L.R.I.B.A., architect, 23, Wallingford-avenue, W. 10, has prepared the plans.

Millbank.—BUILDING.—At a recent meeting of the Imperial Chemical Industries, mention was made of the new building to be erected on the Embankment. Sir Frank Baines, Director of Works at the Office of Works, has been appointed architect. The new building will cost about a million pounds.

Newgate-street.—ALTERATIONS.—Messrs. F. Green & Sons, of 36, Union-street, S.E., have secured the contract for the alterations and additions to premises in Newgate-street, E.C. The architects are Messrs. Boddy & Dempster, F. & A.R.I.B.A., of 19, Palace-street, Westminster, S.W. 1.

Poland-street.—REBUILDING.—The rebuilding of 21-22, Poland-street is being executed by Messrs. Hall, Beddall & Co., Ltd., under the direction of Mr. Dudley P. Hayworth, A.R.I.B.A. architect. The work also includes the demolition and rebuilding of the party wall of the adjoining premises. The principal sub-contractors are: Steelwork, Messrs. Power's & Deane Ransomes, Ltd.; asphalt, Messrs. Ragusa Asphalte Paving Co., Ltd.; granite, Messrs. F. Whitehead & Sons.

Walthamstow.—HALL.—The Walthamstow Council are shortly to consider a scheme for the erection of a new town hall. No architect has yet been appointed.

MANCHESTER BUILDING EXHIBITION

THE tenth Manchester Building Trades Exhibition will be held from Tuesday, March 1 to Saturday, April 9, at the City Hall, Deansgate. It will be found that more and more attention has been given to improvements in building methods and materials.

We append the preliminary list of exhibitors at the Exhibition, with their stand numbers. A full report of the exhibition will be given in our next issue.

bits displayed in nine large cases he plan and progress of about half the hes which this Association has at pre- hand. The field covered is large, sing all the industries concerned with oduction and uses of such metals as lead, zinc, tin and nickel and their ous alloys. The work includes re- s of a fundamental character, such as ly be carried out by co-operative sup- s from their nature they demand pro- and sustained investigation.

y of the investigations, however, are ious practical bearing. Particular at- may be drawn to the exhibit on the heric corrosion and tarnishing of which is of general interest to every- Other exhibits deal with such varied s as "wiped" plumbers' joints, the ess of castings, the improvement of the quality of sheet brass, the spectro- assay of zinc and die castings in ium alloys and in brass and bronze. on is also drawn, by an exhibit in one the highly organised information ser- hich the Association provides for its rs, and the importance of the whole tion's activities is brought out by the ent that in 1926 a total expenditure of £25,000 was incurred on work from members received advance and preferen- rticipation.

exhibition is open to the public daily ow until June, and literature descrip- the material on view and of the other eing carried out by the Association may ained at the Science Museum or from ecretary, B.N.F.M.R.A., 71, Temple Birmingham.

TISH ELECTRICAL DE- LOPMENT ASSOCIATION

James Devonshire, K.B.E., the Pre- was in the chair at the annual dinner British Electrical Development Asso- Inc., which was held at the Savoy on March 17. Amongst those present Sir Ernest Benn, Sir Charles Higham, lip Dawson, M.P., Sir Benjamin Long- Sir Harry Haward, Sir Duncan Wat- r Herbert Blain, Mr. W. W. Lackie, I. J. Railing, Mr. R. P. Sloan, Dr. Eccles, Mr. D. N. Dunlop, Mr. R. B. ll, Mr. R. A. Chattock, Mr. C. W. Mr. T. P. Wilmhurst, Mr. F. J. r, Mr. F. Bailey, Mr. R. W. L. s, Mr. C. J. Easton, Colonel R. E. on, Mr. Ll. B. Atkinson, Mr. A. F. Mr. H. J. Miles, Mr. S. T. Allen, Mr. Harrison, and Mr. J. M. Sim.

loyal toast having been honoured, S. Z. Ferranti, in giving the toast of erative Publicity," said there were two t kinds of advertisers, the people who sters on hoardings and professional ho did their advertising without any- owing they did it. Advertising was ely necessary; all had to advertise, e E.D.A. tried to teach the country vely. It had got the advantage of on a higher plane. He felt, however, ey were spending not nearly enough on ve publicity. If necessary, they should less on individual advertising. He was say that the Electricity Bill had now become an Act. Its object was to standardise processes of production so that those processes might be the more advantageously carried on. The Government had done wisely to have carried through what they had, and now it was up to the E.D.A. to educate people so that they used electricity.

The Right Hon. Charles A. McCurdy, P.C., K.C., responding, said that he agreed with the proposer regarding the admirable work done by the E.D.A. as regarded co-operative publicity. He had studied the literature issued by the Association and had never seen work so splendidly and minutely carried through. It was required, too, for the vast majority of England's inhabitants had no more chance of benefiting by the marvels of electricity than if they had lived in the Middle Ages. There was a great need to educate the public in its uses by co-operative publicity.

Sir Henry Fowler, K.B.E., proposing the "Public Service of Electricity," said that going back to history, two of the greatest services rendered to the community were good roads and good water. The E.D.A. was rendering one of the greatest public services that was to be rendered, the supply of heat, light, and power. He had pleasure in proposing the toast, coupled with the names of Alderman W. Walker and Mr. W. B. Woodhouse.

Alderman Walker, responding, said that electricity had become essential to the life of the community. On looking at it from the production side, he did not think that any call could be made upon electric supply that could not be met.

Mr. W. B. Woodhouse said that he had seen the Association grow from poverty to prosperity, and he thought that if they proceeded on sound lines there was a great future before them.

Sir James Devonshire then proposed the toast of "Our Guests," to which Sir Andrew Rae Duncan responded.

Builders' Apprentices.

Recent official statistics show that there are over 11,000 apprentices at work on 60,000 houses now being built by contract or by direct labour in England and Wales, under scheme approved by the Ministry of Health.

SCIENTIFIC AND INDUSTRIAL RESEARCH

The Report of the Committee of the Privy Council for Scientific and Industrial Research, for the year 1925-1926 (Cmd. 2782), (price 3s. net) has just been issued. It gives an account of the work of the Department of Scientific and Industrial Research during the year ended July 31, 1926, and is divided into the following main sections:—

Report of the Committee of Council
Report of the Advisory Council.
Summary of the Work of the Research Organisations of the Department.

The report is supplemented by detailed appendices giving particulars of Research Boards and Committees of the Department; statistics of grants made to individual research workers; lists of aided researches; summary of finance; information concerning Research Associations; developments in the organisation of research in other parts of the Empire; list of publications by individuals in receipt of grants; list of papers by scientific staffs of Admiralty, War Office, and Air Ministry during the year; and a list of the Department's publications issued, or in the press, during the year. The report is indexed,

Paint Industry.

The Newcastle branch of Messrs. Thomas Parsons & Sons, of London, the well-known manufacturers of varnishes, enamels, Japans, and fine colours, was formally opened on the 2nd inst., at 66-69, Percy-street, by Mr. H. O. Clarke, senior representative of the firm in the North of England, who extended a hearty welcome to a numerous gathering.

Mr. Clarke explained that the firm, established in 1802, had already branches at Manchester, Glasgow, Leeds, Birmingham, Southampton, Bristol, and Norwich. For many years, he said, they had catered for various trades, particularly the motor trade, the house decorating trade, and so forth, and were still endeavouring to keep up the high standard of their products.

Quality, however, was not the only essential in business. There must be quick service, and to ensure that his firm had established depots in different parts of the country.

A Stand at the Ideal Home Exhibition.

[Above is a view of the stand of Messrs. Thos. Parsons & Sons at the Ideal Home Exhibition at Olympia (No. 10 in the New Hall, Housing Section). The stand is effectively treated by the firm in William and Mary green Parso-Glaze.]

ESTIMATING ON RIGHT LINES

Everyone whose business it is to quote for building work should master the principles upon which estimating is based. These principles are clearly explained and illustrated in

'HOW TO ESTIMATE'

by J. T. REA,

a unique and invaluable work which is not excelled in thoroughness or in scope by any similar book known.

Fourth edition (now ready). 540 pages. Price 15s. net (by post 15s. 9d.). Containing thousands of prices and hundreds of examples of analysis, showing how a builder can make up rates for himself. In view of the difficulty of fixing standard prices under present conditions, the author has included an important series of Adaptation Tables and Percentages (corrected to February, 1926), *which show how rates may be adjusted to meet variations at any time.*

Before purchasing any other book on this vitally important subject, you are invited to inspect this—the standard work which is in use by over 30,000 builders.

A COPY WILL BE SENT BY RETURN, AND YOUR REMITTANCE REFUNDED IF THE BOOK DOES NOT SATISFY YOUR REQUIREMENTS.

B. T. BATSFORD, LTD.

Publishers, 94, High Holborn, London, W.C.

APR. 1.—**Southwold.**—REPAIRS.—For (1) repairs t groynes (timber); (2) extensions to groynes (timber for T.C. J. S. Hurst. Dep. £2 2s.

BUILDING TRADE UNIONS

THE scheme for a new confederation of the trade unions in the building industry, by which it is hoped to bring together again under one central control the unions of skilled and unskilled men, has been finally approved by the executive council of the existing National Federation of Building Trade Operatives and will be circulated to the unions affiliated to the Federation. The scheme will be considered at the annual conference of the Federation in June.

It is intended, says *The Times*, that the new confederation shall include and supersede the existing organisation. It would be governed by an elected central executive council, and for the purpose of safeguarding technical, craft, and labourers' interests it is proposed that eight groups should be formed representing bricklayers, masonry (including quarrymen and paviors), woodworkers, painters, plumbers, slaters and tilers, plasterers, and labourers respectively. Organising work would be vested in the confederation and for administrative and organising purposes the country would be divided into 12 divisions, each of which would have an adequate organising staff and a divisional secretary. These divisions would be based on London, the Southern Counties, South-Western Counties, Eastern Counties, South Midlands, North Midlands, South Wales, Yorkshire, North-Western Counties, the North-East Coast, Scotland, and Ireland. The confederation would be autonomous on all questions affecting industrial policy. The object of the scheme is to bring together in one organisation about half a million workers, who would include not only building operatives, but also workers engaged in the manufacture of builders' materials. Before the secession of the bricklayers, who belong to the Amalgamated Union of Building Trade Workers, and the plasterers in the Plasterers' and Granolithic and Cement Workers' Union, the present federation had about 300,000 members. It has yet to be seen whether the unions which broke away in 1925 will find the proposals sufficiently attractive to surrender in the cause of unity their power to act separately.

COVENTRY AND DISTRICT BUILDERS AT DINNER.

THE annual dinner of the Coventry and District Association of Building Trade Employers was held on the 15th instant, Mr. Alfred Clarke presiding.

Proposing the toast of the National and Midland Federation, Mr. Clarke said the apprenticeship scheme was working much better than he had anticipated. Present-day apprentices, he thought, were far superior to those of earlier days. That was a fine thing for the industry as a whole. They assisted the apprentices not only in the workshops but by sending them to continuation schools and technical colleges. He must say that he would prefer the apprentices to go to those technical colleges in the daytime, when their minds were fresh and their bodies not tired. He hoped some day they would be able to send them to universities.

Mr. W. Webster, replying, said he would like to refer to the friendly relationship existing between themselves and the operatives, and the signing of the National Agreement. Payment for wet time was the stumbling-block with regard to the bricklayers. He was one who thought that there should be some method of payment for time lost through inclement weather. It would have to be done through insurance, because nobody could control the weather. The North-Western Federation had put forward a good insurance scheme.

Mr. H. Eyles, also replying, said that but for the Federation the industry would be in a chaotic state.

Councillor W. Ivens, proposing the toast of "The Guests," said he was afraid Coventry builders were rather too modest in making themselves known to the general public. Perhaps some of them saw the account of the erection of a concrete house at Westminster in 3½ days. But they were not told 50 men worked day and night, by flares, to complete the house. They did not advertise that in Coventry one firm had been producing houses for several years at the rate of a house for every 7½ working hours, taking as a basis a 46½ hour week in summer and 44-hour week in winter. Another firm had produced one house every 27 hours over a period of four years. A quite small firm had been completing a house every 29 hours for the last three years. It was right that attention should be called to those facts.

PROPOSED NEW BUILDINGS & OTHER WORKS*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education; M.A.B. for Metropolitan Asylums Board; and M.W.B. for Metropolitan Water Board.

FOLLOWING is a list of abbreviations:—Borough Surveyor, B.S.; Borough Engineer, B.E.; District Surveyor, D.S.; Clerk, C.; Town Clerk, T.C.; County Engineer, C.E.; County Surveyor, C.S.; County Architect, C.A.; Surveyor, S.; Engineer, E.; Borough Architect, B.A.; Architect, A.

Piccadilly-circus Pipe Tube.

The principal difficulty of the many which the engineer has been confronted in nection with the new Tube station of Piccadilly Railway has been the deflectio the L.C.C. pipe and cable subway run below Shaftesbury-avenue and ending in middle of the Circus. As this site wil occupied by the great circular booking-ha the new station, this pipe subway has ha be cut off and provision made elsewhere the various pipes, cables, wires, etc., conta in it. These are accordingly being bro down to a lower subway, 570 ft. long, w practically goes round the Circus at a d varying from 12 ft. to 30 ft. below the level.

Edinburgh Cenotaph.

The Lord Provost's Sub-Committee of Edinburgh Town Council has considered a letter from Colonel A. S. Blair, Hon. Secretary of the Edinburgh Citizens' Cenotaph Committee, stating that the committee had unanimously resolved to drop the proposal to erect the Cenotaph in St. Giles'-square. The sub-committee has now resolved to recommend that the site in front of the City Chambers be granted.

NEW BUILDINGS IN SCOTLAND

Edinburgh.—School.—A report has been submitted and approved by the Education Authority on the recommendation of a Special Committee on the Educational Requirements of the area recommending a new school for the area in or near the Wardie district, and that accommodation should be provided for 700 pupils.

Rutherglen.—Hall.—The Dean of Guild Court has granted the Baptist Church approval to erect a church hall and caretaker's house at the east end of Greenhill-road, at a cost of £3,500.

Elgin.—Alterations.—The Moray E.C. has approved the estimates for the proposed alterations at the Girls' Technical School.

Dundee.—Building.—Plans and sections of proposed new buildings, &c., have been lodged at the office of the City Engineer and submitted to a meeting of the Works Committee as follows :—Benvie-road, alterations for Dundee Eastern Co-operative Society, Ltd.; Hazel-drive, villas for Hazel-drive Building Co., architects, Messrs. MacLaren, Soutar & Salmond, 1 South Tay-street; Lowden's-alley and Wilkie's-lane, fence for Dundee Education Authority; Norrie-street, Broughty Ferry, houses for Mr. Wilson, architects, Messrs. Gauldie & Hardie, 2 Commercial-street; Strathmore-avenue, shop and house, for Raffaele Caira.

Edinburgh.—Crematorium.—The Edinburgh Corporation has instructed the Town Clerk to write to the secretary of the Crematorium Society stating that, if the society could provide a crematorium, the Corporation would co-operate with them with a view to endeavouring to provide a site.

Keith.—Houses.—The Town Council has considered site for the erection of 16 houses.

Lennoxtown.—Houses.—The Housing Committee of the Western District Committee of Stirlingshire County Council are to consider the erection of 30 additional houses in Lennoxtown.

Buckie.—Houses.—The Town Council has decided to erect 24 new houses as the fourth development of their housing scheme.

Jedburgh.—Houses.—The Town Council has adopted the proposals for the extension of the municipal housing scheme, by the erection of 24 additional houses on a site at Friars Mount.

Gorebridge. — Houses. — The Midlothian County Council has resolved to proceed with the erection of 52 houses at Gorebridge. Mr. James D. Cairns, 63, George-street, Edinburgh, has been appointed architect for the scheme.

Stirling.—Home.—The Town Council has decided upon a scheme in conjunction with the directors of Stirling Royal Infirmary and other local authorities for the provision of a maternity home as an addition to the new infirmary at Livilands.

Dundee.—Extension.—At a quarterly court of the Governors of Dundee Royal Infirmary Mr. R. Still, in making an appeal for £10,000 for the enlargement of the infirmary, said the plan showed a hospital of 35 beds, and the building would be of two stories and basement.

Greenock.—Cinema.—The Greenock Picture Palace Co. have purchased a site in Brougham-street on which to erect a new picture house to take the place of their present cinema.

Buckie.—Extension.—The Unemployment Grants Committee have informed the Town Council that they are prepared to give a grant limited to £3,810 in carrying out the proposed excavation and grading of the fifth or eastmost basin of the Cluny Harbour, estimated to cost £5,500.

Falkirk.—Building.—The Dean of Guild Court has sanctioned the following plans :—Falkirk and Counties Savings Bank to reconstruct the head office, 137, High-street, at £9,100; Messrs. R. & A. Main, Gothic Iron Works, Camelon, extensions in their foundry at £1,400; Burnbank Foundry Co.., Ltd., alterations to their works, at £340; Mr. F. O. Robinson, house at Camelon-road, at £1,300.

Edinburgh.—Extensions.—The Rev. Dr. H. Muller, Warden of the Pleasance Trust Settlement, has just recently made an appeal for £16,000 to make up the £30,000 required for the extension of the New College Settlement.

Gift to St. Andrews University.

At a meeting of the University Court of St. Andrews, Principal Sir James Irvine intimated that a benefactor, who desired his name to be withheld, had offered the sum of £100,000 in appreciation of the progress made in the development of the University. Towards the cost of the new Residence Hall for men students £29,000 has been allocated, while the sum of £8,000 is to be devoted to the improvement of the University Chapel. The funds at the disposal of the Court for the building of the Residence Hall amount to £70,000. Plans for the building were approved, and the Court resolved to proceed at once with the scheme.

BUILDING TRADE WAGES IN SCOTLAND.*

The following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Bricklayers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Labourers—Masons', Bricklayers', Plasterers'.

Patchett's Concrete Works, Ltd. (219,054) Registered January 19. Concrete manufacturer. Nominal capital, £2,000.

TRADE NEWS

Wet Rubbing Down.

In connection with wet rubbing down good results, it is claimed, are obtained by the use of a solution of "Manger's Improved Sugar Soap" with the waterproof sandpaper. This takes the place of washing down, thus saving the time usually spent in rubbing down afterwards. The rate of "cutting" or "biting" is quicker than with water, also the sandpaper cleans more easily.

Travelling Film Exhibition.

The National Radiator Co., Ltd., of Hull, advise that they have arranged for the exhibition of their film showing manufacture of "Ideal" boilers and radiators in the "Renaissance" room at the Carfax Assembly Rooms, Oxford, at 7.30 on Tuesday, 29th inst. A cordial invitation is extended to all members of the architectural profession or building trades interested.

Wood Block Flooring.

We are informed that amongst the recent works in which the "Zeta" Wood Flooring (1910) Co., Ltd., have laid "Bennett's Patent Bed-grip and End Tongue System" of wood block flooring are: The Northcliffe House, E.C.; *Daily Mirror* Offices, E.C.; *Daily Express* Offices, E.C.; New Science Block, Leys School, Cambridge; New Science Building, Merchant Taylor's School, E.C., and Victoria House, Bloomsbury-square.

A £250 Competition for Builders.

Elsewhere in this issue of *The Builder* is an announcement dealing with a fascinating and practical competition for builders promoted by the Rawlplug Company. Enterprising builders are always discovering new uses for "Rawlplugs," and there seems no limit to the number of fixing jobs which can be done more efficiently with "Rawlplugs." Articles weighing several tons can be firmly fixed into brick, concrete, stone, &c., with the larger sizes. In view of these facts, it is interesting to learn that the Rawlplug Company, Ltd., are offering £250 in prizes in a simple contest for users of Rawlplugs. Competitors have to estimate the number of Rawlplug jobs in interior and exterior views of a house which is illustrated. Full particulars as to the rules of the competition will be found in the Rawlplug Company's announcement; or may be obtained from the Rawlplug Co., Ltd., Rawlplug House, Cromwell-road, S.W. 7.

Coke-heated Domestic Boilers.

The Nautilus Fire Co., Ltd., of 60, Oxford-street, W. 1, have issued an attractive booklet in which is set forth the points of their well-known "Nautilus" coke-fired boiler. Advantages claimed for this type of boiler are cleanliness in use, mild steel construction electrically welded, which will not crack, and a separate trivet and door. The booklet will gladly be sent upon request to the makers.

Lifts and Door Springs.

Messrs. Smith, Major & Stevens, Ltd., makers of the well-known "S.M.S." lifts and "Janus" door springs, of Abbey Works, Northampton, and Bolan-street, London, have appointed Messrs. R. N. Eaton & Co., 1, Foster-square, College Green, Dublin, to act as their sales representatives in the Irish Free State.

"The Roadmaker."

The March publication of this little journal, which is issued by the British Reinforced Concrete Engineering Co., Ltd., of Smith-square, S.W.1, and Stafford, contains a number of interesting articles, one, "London Transformed," being a very sound review of the cross-river traffic problem. The series of "Imposing Streets" is continued, this month's subject being the Ringstrasse, Vienna, while Mr. D. Rees Jeffreys contributes a valuable article on "The Finance of Roads"—who shall pay and who shall spend? The journal will be forwarded to anyone interested upon application to the publishers.

TENDERS.

Communications for insertion under this headi should be addressed to "The Editor," and must rea him not later than Tuesday evening.

* Denotes *accepted.*
† Denotes *provisionally accepted.*
‡ Denotes *recommended for acceptance.*
§ Denotes *accepted subject to modifications.*

THE BUILDER

A JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

L. CXXXII.—No. 4391. APRIL 1, 1927.

THE PRESERVATION OF ANCIENT COTTAGES

AN illustrated pamphlet has been published by the Royal Society of Arts,* which contains an appeal by the Prime Minister on behalf of the Society's fund for the preservation of ancient cottages, and a note by Mr. Thomas Hardy. It is possible that there are people who are inclined to sneer at Mr. Baldwin's sentimental appeal to save these cottages. They have certain preconceived ideas about old cottages and their relation to comfort. They are aware of the lure, but they cannot appreciate it. Fortunately, there are others who not only think differently, but give their time and money freely in their efforts to save us from ourselves. Later generations will bless them. That much we can prophesy. Almost all our old cottages are a delight to the eye; some are uncomfortable and some are, no doubt, unhealthy. A few pounds spent on repairs would, in many cases, remedy matters, and in the worst of them, we imagine, it would cost less to repair them than to build new houses. After all, it cannot be urged that domestic architecture has altered in its fundamentals. Sanitary science and hygiene have not made any revolutionary changes in the elementary functions of a dwelling. Indeed, most of these old cottages have lived long enough to catch on the rebound some of our ideas on hygiene. There are many Victorian houses, with their 14 ft. ceilings, which would require more alterations to please us than many of the cottages illustrated in the pamphlet.

Mr. Baldwin's appeal is based partly upon historical grounds, but he carefully emphasises that these cottages are to be preserved "not as museums but as homes." This observation is significant, and not the least point of the significance lies in the certainty that if we postpone much longer the preservation of these cottages, there will be frantic efforts in the end to preserve what is left as museums. Scarcity and rarity seem to be of the essence of the museum appeal. Much more rational is Mr. Baldwin's effort.

In many respects it is an extraordinary thing that an appeal should be necessary to preserve our old cottages. There are several places we can think of where chars-a-bancs and tea-gardens reap their annual harvest of visitors. The visit to these "old-world villages"—as they are termed—is recommended by every hotel and boarding house in the neighbourhood. One wonders what is in the minds of these people when they see every now and again another fine old thatched roof shamelessly replaced by corrugated iron or asbestos slates. It is difficult to place in any æsthetic category these exploiters of the picturesque, but, at least, we would expect from them that they were not insensible to the market value of beauty. To be fair, we believe that they regret, as we do, the handiwork of the vandal, but (they say) they are powerless to prevent the damage. As we motor through the country we see the local builder doing his worst, and we pass by with the observation that it is a pity anyone should be allowed to do these things. It is an old story: it is nobody's business. Happily the Society of Arts has realised the need not only to rouse public opinion, but to deal with a problem which the individual has failed to grasp. A network will be spread over the whole country, by means of which an Advisory Committee will be kept informed of all cases calling for consideration. The Society will be able to place its organisation at the services of the Fund, and advice and assistance will be given. Practically all the money subscribed will be available for the actual work of preservation. During recent years the motorist has complained bitterly about the spread of the ugly modern bungalow, and the destruction of the countryside. Here is his opportunity to contribute to an excellent cause.

We come to a personal matter. Writing, as we do, for those connected with the art of building, we are conscious that this appeal has a particular significance. The endeavour to save our old cottages—or rather the fact that there is an appeal for help to save them—has an obvious moral. This appeal is not simply another example of our racial genius for wisdom after the event: it postulates a hope that we should aim to make an end of our dreary efforts in house-building. These old cottages are not only beautiful in themselves, they are gems in comparison with our substitutes. We quote Mr. Baldwin: "While we all recognise that good housing is, and ought to be, a great civilising power, we have to confess that we and our immediate ancestors have neglected it both from that point of view and from every other point of view." Clearly, Mr. Baldwin's conception of a house is something which is not merely weather-proof and connected to a drainage system. He realises that a great many modern houses and bungalows are not ugly because they are efficient, but because neither thought nor taste are in evidence.

When we come to consider the remedy, the doubt creeps in whether we are all looking in the same direction. "We have to see," says Mr. Baldwin, "if we cannot once again tap the springs of craftsmanship which have not flowed in this country for so long." Most of us have our own conception of what we mean by craftsmanship, and it is well we should be explicit. If we are to regard craftsmanship in the art of building as a native art, and we are to look to the local builder to supply it, we confess we have little hope. He has lost his anchor; he has lost his hold of tradition, and does not know what it means. We have to make up our minds whether we think craftsmanship is lying dormant among the people, or whether the evidence of our eyes points to the conclusion that it is dead. On the other hand, if we are to regard the architect as a craftsman, we can look forward with some degree of confidence. One reason, at least, is simple to understand. It is based upon a philosophy which is receiving attention from many educationists. Briefly, it rests upon the theory that a full knowledge of traditional thought and method is essential for future progress of any kind. Without this knowledge, what we assume to be progress may be merely movement, and it is almost certain to be revolutionary rather than traditional. We have not the space to press this philosophy, but it is not difficult to see that traditional methods of building have not been strong enough to counteract lack of knowledge. This may be the fault of our industrial system in its effect upon the workman, or it may be due to a number of causes which we cannot examine here. Our point is that these old cottages illustrated in this pamphlet possess a homely charm and beauty. To the layman these qualities may seem to have their roots in antiquity; to the architect they are as understandable as the qualities of good prose.

We need not apologise for our interlude. If we are starting an intensive salvage scheme for ancient cottages, it is equally important to outline our hopes and fears for the future. We can with pleasure support the appeal for assistance. The present moment is opportune, and we believe that the response will be liberal.

* "The Preservation of Ancient Cottages." Published by the Royal Society of Arts.

NOTES

St. George's Hall and the Cenotaph.

From correspondence we have received in reference to the position of the Cenotaph at Liverpool, it is made quite clear to us that a considerable number of Liverpool architects agree with the criticism which has been directed against the site allotted to it. We should like to make it quite clear that we do not associate ourselves with any attempt that may have been made to belittle Professor Budden's admirable design, but we have grave doubts whether the beautiful stretch of open space in front of St. George's Hall should be utilised for any monument, or at all events one of the size of the Cenotaph; moreover, there are, we believe, excellent sites available elsewhere.

"The Builder" Criticisms.

A Liverpool architect has informed a Liverpool contemporary that *The Builder* is "a builders' paper and not an architects'," and that we have previously indulged "in a similar sort of campaign after the Manchester competition." In all modesty we do think that after all *The Builder* has attempted to do for many years past for the architectural profession, we can safely leave such a comment to the judgment of our readers, only adding that the criticism must have emanated from someone who is either very ignorant of the facts or that his observation is due to a consciousness of the soundness of the criticisms we have ventured to make.

Our Leader.

We write this week on a subject which will appeal to every architect. During the last few years we have seen an awakening interest in the preservation of good architecture. There are limits, of course, to this, but the movement within these limits is a healthy one. Let us hope that this interest is the prelude to a genuine desire for architectural beauty in our homes and our surroundings. Our ancestors left us a rich heritage: we, on the contrary, illustrate the attitude of the politician who queried what posterity had done for us. It is hardly selfishness on our part that we are doing very little for posterity; we are suffering ourselves. Contributions to the fund for the preservation of our ancient cottages should be made payable to the Royal Society of Arts and crossed "Messrs. Coutts & Co., Fund for the Preservation of Ancient Cottages," and addressed to the Secretary, Royal Society of Arts, John-street, Adelphi, London, W.C.2.

Waterloo Bridge.

A strong plea for the retention of Waterloo Bridge at its present width is put forward in a recent letter to the *Morning Post* from Mr. W. Worby Beaumont. He draws attention to the fact that the Rennie Bridge is and has been of ample capacity for the conduct of far greater vehicular traffic than can be dealt with either in the Strand or at the southern approach. He goes on to say that a six-track bridge would be superfluous, and points out that the "really wanted traffic relief would be obtained by the construction of a new bridge near the existing bridge at Charing Cross. It seems necessary to recall the fact that the Royal Commission dwells with emphasis on this in several paragraphs, for example: 'It has been urged upon us that Charing Cross is where relief is most wanted—that everything turns and hinges upon Charing Cross, that it is of the first importance among new bridges and that viewing the bridge problem as a whole, it would probably be the most economical project to adopt . . . we are ourselves convinced that in the interests of traffic a new road at this point is essential.'" The letter goes on: "It is not necessary that the suggested double high level bridge should even be considered for the present, if ever. What is wanted and could be carried out with the least inconvenience to river traffic is a three or four span bridge near the present bridge, with a rise sufficient to give somewhat greater headroom than the Westminster Bridge and with approach at the Middlesex end near Whitehall and Northumberland-avenue."

Copyright in Design.

A correspondent asks us whether anyone is at liberty to adapt a suggestion of plan which was published in our pages, or whether it is the copy-

Norman Chancel Arch in Tickencote Church, Rutland.

[This arch, a notable example of Norman construction, recedes in five orders. The piers have yielded laterally, and the arch has consequently become depressed.]

nt of the architect. We may at once plain that every architect whose designs publish in our pages does by every dition of courtesy and equity retain copyright of his design. As our ders know, the legal aspect of an hitect's copyright in his plans is open argument, and we cannot doubt that ny points of designs which are pub- ed afford valuable suggestions to hitects and others. If anyone chooses crib suggestions without any very ct or definite copying there is nothing prevent it, unless it be the conscience the adaptor. A very good rule in s as in all the other problems of our ions is to put ourselves in the place others from whom we propose to adapt crib or "steal." The world would be nsformed if we all did to others as should wish them to do to us.

Tradition. We refer to this subject in our leading article. Perhaps nothing better has been written than the following ract from Mr. Aubrey de Selincourt's ay in "Streams of Ocean." "Tradi- n," he says, "the value of it and the aning of it, is a difficult thing properly appreciate. . . . Without tradition— hout, that is, the handing on from one eration to another the torch of hered experience—all human activity cessarily becomes abortive and chaotic. art and literature this can be seen in the rk of certain moderns who, too im- ient to realise this salutary truth, have lently rejected tradition simply because y have failed to grasp its significance. the other hand, tradition must ever and indeed never in its true meaning a static thing, but instinct with the rit of growth, and (paradoxical as this y seem) delicately sensitive to the anging temper of each successive age. modern writer in the great English dition is not he who consciously sets t to perpetuate or to revive earlier or haic forms, but he who, having sorbed by long and loving familiarity spirit, the atmosphere, the high devo- n to the best interests of art, of the at writers of old, re-distributes, uncon- ously perhaps, but nevertheless faith- ly, and in a form determined by his n personality and the dominating mper of the age, the distilled essence of at gathered harvest."

struction. Mr. Max Beerbohm, in an essay on Prangley Valley, refers in his own inimitable way to our love of destruc- n—a thin disguise to cover our insensi- ity to beauty. The following extract hich we take the opportunity of quoting om "More," has some interest to those ho are concerned about our old cottages. 'All men kill the thing they love,' was e keynote of a fine ballad which every- e has read. And, indeed, it does seem at in all love for animate or inanimate ings there is an ogre-ish element; manity, in its egoism, being unable to preciate anything, unless it has also wer to destroy it. The comparative indifference with which the ancients regarded landscape might be traced to their lack of tools for its destruction. We, in this century, suffer from no such lack, and our love of landscape is quite unbounded. We have water-towers wherewith to cap our little hills, railway-trains to send along the ridges of our valleys, coal-shafts to sink through ground where, for many centuries, forests have been growing. We have factories, too, for the marges of wide rivers, texts about pills and soaps for the enamelling of meads, and telegraph-wires for the threading of the air, and tall, black chimneys for all horizons. Month in, month out, with tears blinding our eyes, we raise tombs of brick and mortar for the decent burial of any scenery that may still be lying exposed. A little while, and English landscape will have become the theme of antiquarians, and we shall be listening to learned lectures on scenology and gaping at dried specimens of the trees, grasses, and curious flowers that were once quite common in our counties."

Cottage at Bramhall, Cheshire.

Architectural Stamps. We understand that distinctive stamps for sums of 2s. 6d., 5s. and 10s. will shortly be issued in the Free State, and that they are to include among the designs reproductions of old engravings showing three of Dublin's greatest buildings—the Customs House, Four Courts, and General Post Office. At present over-printed British stamps are being used for these high values. It would be interesting to see a collection of stamps on which architecture has been represented. One of the most dramatic is, perhaps, the great Roman aqueduct that figures in a Tunisian issue. It is difficult to estimate the effect upon public appreciation of buildings, but their illustration on stamps would reach a very wide circle on account of the stamp collectors.

"Architecture." We give this week an illustration of a charming half-timbered cottage at Bramhall, Cheshire, reproduced from the current number of *Architecture*. Our contemporary has some further trenchant remarks to make on the subject of Architectural Criticism, while Miss V. M. Christy writes in interesting fashion on "Curves." We commend also to the reader's attention an article on Tang Pottery Figures, by Mr. Reviers-Hopkins, and Mr. Dudley Harbron writes entertainingly on "Amphion, or the Nineteenth Century." Illustrations of the month include some fine exterior and interior views of houses at Holmbury St. Mary and Lynwood Chase, Berks, the work of Mr. Oliver Hill.

K

GENERAL NEWS

Professional Announcement.

Messrs. Cheadle & Harding have dissolved partnership. Mr. Cheadle is now practising at 2, New-square, Lincoln's Inn Fields, and Mr. Harding, at 46, Beauchamp-place, Brompton-road.

Ashridge Park.

Ashridge Park, the section of the Chilterns near Berkhamsted, lately acquired by the National Trust, will be open to the public on Saturday next and on succeeding Saturdays, Sundays, and Bank Holidays. The portions of the Park included in the purchase are rich in timber, while outside the Park fence there are beech glades and a fine walk to Beacon Hill, which commands a great expanse of the countryside.

The National Association of Master Heating and Domestic Engineers.

The twenty-third annual general meeting of this association was held on March 16, in the new offices at 12, Russell-square, London, W.C. 1, when the year's work was reviewed and satisfactory reports on progress and developments were made. Office-bearers were appointed for the coming year, the new president being Mr. James Elliott.

Stonework of Houses of Parliament.

We understand that £30,000 has been voted for this year's repair of the stonework of the Houses of Parliament. This is the first instalment towards the sum of £1,062,350 which, it is estimated, will be necessary to complete the work during the next twelve or fifteen years. All the defective stone is to be replaced, and for the repair of the main building Stancliffe stone, a silicious sandstone, is to be employed. Objection is, however, being taken to the use of this stone on the ground that it is detrimental to the health of the workmen engaged on the task, and Labour members have suggested that Portland stone should be used instead, a proposal which has also been made by a deputation from the building trade to the First Commissioner of Works. It is argued on behalf of the Office of Works, however, that the use of Portland stone would involve the refacing of the whole building, and it is estimated that in that event the total cost could not fall short of £4,000,000.

Rebuilding of Abingdon Bridge.

The Berkshire County Council has adopted a report of the Finance and General Purposes Committee, stating that they had approved a design for widening and reconstructing part of the Abingdon bridge on the Oxfordshire side, including the navigation arch. The design had also been approved by the Office of Works and the President of the Royal Institute of British Architects. The present design, it is understood, provides for the taking down of most of the existing structure and the rebuilding of part of it in the same style and as nearly as possible with the same stone.

A Housing Record.

Speaking on the housing problem at Swindon on Tuesday, Sir Kingsley Wood, M.P., Parliamentary Secretary to the Ministry of Health, said that since 1923 no fewer than £40,000,000 had been advanced under the Small Dwellings Acquisition Acts, and the number of owner-occupiers was rapidly increasing mainly owing to these Acts and particularly to the great building societies of the country. For the year ended September 30 last we had built and actually completed no fewer than 197,584 houses—a record for the country. It was noteworthy that during the year over 65,000 houses had been built without any State assistance whatever.

Charing Cross Bridge.

London County Council decided on Tuesday to endorse a recommendation that they should give effect to the proposals of the Royal Commission on Cross River Traffic as to Waterloo Bridge, provided that steps be taken to construct a bridge and approaches at Charing Cross, on the basis that the Government v contribute 75 per cent. of the actual expen ture in each case. The Finance Commit point out that if the recommendations agreed to, "the Council will be contingen committed to both works," and add:

"The approximate cost of the Charing Cr Bridge proposal, as stated in the Royal Co mission's report, is £7,500,000, to which added 10 per cent. for contingencies, mak a total of £8,250,000."

This only represents the net cost of works, they add, and several million pou would have to be added to arrive at the gr cost. The Council's net liability would about £2,500,000.

Lectures on Architecture for Workers in t Building Trade.

The last of this series of lectures was given Tuesday, March 22, in the R.I.B.A. Galler Mr. Henry M. Fletcher, F.R.I.B.A., presid and Mr. H. Jarman (Superintendent of Wor H.M. Office of Works) read a paper illustrated lantern slides on "General Materials." At conclusion of the paper a discussion took pl

New Belfast Law Courts.

In the Northern Ireland Parliament the Prime Minister (Lord Craigavon) intimated that work would be begun on the erection of the new High Courts in Belfast within two months, and that the buildings would provide accommodation not only for the Courts, but also for some of the Government offices. The British Government was providing the new Law Courts in addition to the Parliament House and administrative offices at Stormont, and the cost would be over £500,000. Two plans of the new Law Courts had been prepared, one for a building faced with brick, and the other for one faced with stone. The Northern Government had been able to persuade the Imperial Government to go on with the building which would be faced with stone, in order that it should harmonise with the City Hall and other stone-faced buildings.

Memorial to John Sinclair, First Baron Pentland of Lyth.
MESSRS. LANCHESTER, LUCAS & LODGE, FF. and A.R.I.B.A., Architects.

CORRESPONDENCE

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

Registration of Architects.

SIR,—In part reply to Professor Pite's inquiry and your leader (March 18), may I point out that the Architects' (Registration) Bill *does* contain a definition of "Architect." It is partly negative and partly positive. On the negative side: No one is an architect who is not registered. If the Professor himself omitted to register he would not be entitled to describe himself as an architect. On the positive side the essentials to secure registration are three, and all must be complied with:

1. Refers to technical ability. The applicant must satisfy the R.I.B.A. Council (as authority to administer the Act) that he is fit to be enrolled, and that may be (*a*) on the evidence of existing building; (*b*) on evidence as shown in examination by those who have had no opportunity to produce building; (*c*) gentle diplomacy in the art of persuasion—the Council will be absolute in this matter: it may refuse to accept professors and it may recognise the vital spark in the budding office boy.

2. The applicant for registration must submit to "professional discipline and control" and must be of good moral character. A good example of this sort of thing is to be seen in a letter from the R.I.B.A., asking that members will *not discuss* these registration proposals in the technical Press. One way, I suppose, of securing unanimous support.

3. The payment of fees and subscriptions in connection with registration. There is no actual limit set to these, which may be *ad valorem* like the income tax, or lump sums, which obviously hit hardest those with the smallest practice. Without these three positive qualifications the man is no architect.

Next, I would like to remind your readers that Acts of Parliament are curious things, and are apt to hit or to be evaded in the most unexpected ways. From the moment when some crank starts the idea to the moment when the Act becomes operative there are usually heaps of compromises with vested interests, and the more the compromises the less anyone knows what the result will be. From the moment the Act is operative, it is not the promoter's intention but the actual wording of the Act as interpreted by Judges of the High Court that will count, and they will study the wording of a clause in relation to the aim of the Act as a whole.

Now let everyone read this Bill carefully and they will find the one and only aim is to protect the use of the WORD "Architect." There is nothing whatever to prevent anyone building (subject to the usual by-laws) or to compel the building owner to employ one of the registered "architects." There is nothing to compel any well-trained and properly-qualified man to register as an architect; and there is nothing to prevent the unqualified carrying on those functions that are usually recognised as architects' work, provided always that the man who is not registered does not style himself "architect."

I will venture on another point on which so far I have seen no comment. The ordinary words "permanent" and "temporary" are relative terms. In the ordinary way an Act of Parliament is "permanent," that is, it remains until some new Act repeals it. The Institute is "temporary" in the sense that there is nothing in its constitution to prevent the members winding up the organisation. Under the Bill we are asked to expect that Parliament will delegate a definite "permanent" duty (viz., maintenance of a Register to define an architect) to a "temporary" body that might conceivably be wound up and cease to exist in a year or two, or even before the Register was complete. Where would the statutory definition of "architect" be then? Are there any "Standing Orders" of Parliament to deal with such a matter? Some years ago the Great Central Railway obtained Parliamentary sanction to extend to London and join up with the Metropolitan Railway and run over Metropolitan metals to, I think, Baker-street; but although the Act was passed the Company were never allowed to do what, apparently, it permitted. Railway working arrangements were subject to the regulations of the Board of Trade (?), and this body said at once they would not permit the running of Great Central trains over the Metropolitan metals, and a new Act for an entirely new line to Marylebone was the consequence.

"Sky signs" give another curious instance. These dangerous and hideous structures on the roof were the subject of special regulations by the L.C.C. under an Act for this purpose. A wrot-iron sign on the wall at first-floor level, overhanging the public footpath, was objected to as a "sky sign" because it happened to be over a vault below the pavement. It ceased to be a "sky sign" by removing the vault, without alteration to the sign. In these ways the scheme which Parliament sanctioned was rendered abortive by the Board of Trade, and the "sky sign" which the regulations condemned was removed from their influence by the removal of something else, *i.e.*, the building under it.

In conclusion, I agree with Professor Pite that a proper definition of "architect and architecture" is badly needed, but not for the Bill only (which I imagine is destined never to mature) but for general use. I fear we shall never achieve the definition, because each of us has his own particular view based on his own personal ability or lack of it.

Quite recently in these columns, I believe, Mr. Voysey has claimed that Pugin, not Barry, was really the architect of the Houses of Parliament. How far dare we extend that principle? It applies, of course, to Thomas Verity, Townroe, and many others in the case of the South Kensington buildings attributed to General Scott and Captain Fowke. Is it not notorious that certain West End buildings own an unacknowledged touch to Norman Shaw? Was Brydon or the Office of Works the architect of the Government Office block at the corner of Parliament-street and George-street? Sir Reginald Blomfield has told us 90 per cent. of modern building has no architect at all. More recently he has been adding façades to the structures of others. Is he the architect of these buildings or, like Pugin, the servant of the other man?

I, for one, am old-fashioned enough to regard "architect" as the term to be applied to the master mind that conceives the building as a whole, for which reason Barry was the architect of the Houses of Parliament, quite apart from whether he did or did not prepare a particular detail with his own hand. It is exactly the same with Wren and St. Paul's or General Scott and Captain Fowke at Kensington. Pugin, Grinling Gibbons, Tijou, Verity, Townroe, etc., all contributed essential details that the chief did not and perhaps could not prepare, but that does not constitute them the architects any more than constructional steelwork firms are the architects of the new Regent-street.

HORACE R. APPELBEE.

The Registration Bill.

SIR,—Mr. Maurice Kiddy, Secretary of the Institution of Structural Engineers, writes claiming that members of his society are fully qualified to grant certificates for payments to a contractor. Of course they are; but this work is not architecture. Mr. Kiddy claims that the favoured and exempt societies have stiff examinations; that also is true, but not one of them has any examination in architecture. I am surprised to find that there are no less than seven non-architectural societies exempt from the operations of the Bill, including the Auctioneers' and Estate Agents' Institute and the Incorporated Society of Auctioneers.

The great cry for a Registration Bill arose years ago in the provinces, and our mem very rightly complained that the local auctio and house agent was doing an architect's w and that the R.I.B.A. ought to promote a to stop it. But the Bill before me does propose to do so. Indeed, it seems to me t the auctioneers and estate agents will be far stronger position if our Bill is passed t they are at the present time. To-day an ar tect can say to a friend, "Why do you go t auctioneer, unqualified in architecture, to d architect's work?" But in the future, if Bill becomes an Act, the auctioneer will be to say, "My architectural qualifications ar high that the R.I.B.A. has obtained an which gives statutory recognition to me other auctioneers to do exactly the same ar tect's work as members of the R.I.B.A. Altho we do not call ourselves architects, it is obv that the Institute considers our qualificat are equal to their own, and has very prop placed that fact beyond dispute by the Ac Parliament it has obtained."

Instead of a Bill to promote the inter of architects, the R.I.B.A. is advocating a that will be of enormous benefit to the thousa of auctioneers and house agents in the se societies I refer to, and if passed it must d very serious damage. Every architect who the interests of his profession at heart shoul all he can to oppose the Bill. If it is thrown the R.I.B.A. will no doubt draft another Bi promote not only the interests of architects, also that of architecture.

INTERESTE

Architectural Staff Salaries.

SIR,—The timely letters which have appe in your columns from Mr. John Mit Secretary, A.A.S.T.A., cannot fail to pro much heart searching among salaried archit The salaries quoted are quite common, this week the number is increased by a fur notice from the County of Hereford, w requires the services of an assistant in nection with architectural and school wor £150 per annum, 5 per cent. payable to su annuation. The actual salary which wil available to the unfortunate successful didate will be about £2 14s. 8d. per week.

Not only is this less than an operative's we wage, but it is open to question if a ge labourer would accept such terms. Mr. Mit mentioned the wretched salaries paid in mouth. I know of a case in a town w an assistant was in receipt of a disable pension, and his employer, a private archi paid him about 30s. a week to make up salary to existence level. Basic mini salaries, in my opinion, and in the opinio many of my colleagues, are an absolute nece if such scandalous underpayment is to checked. The A.A.S.T.A., of which I a member, is tackling in the right manne abuses abounding in professional life.

On the occasion of the last building di the R.I.B.A., or certain of its more prom members, made overtures to act as media Should the occasion ever arise again, it be hoped that employing architects will put their own house in order by recognisin fair claims of their salaried colleagues.

A.R.I.B

The Limitation of Open Competitions

SIR,—I have followed with interest the respondence in your columns on the su of "Limited Architectural Competitio The inclusion of any clause in the condi of entry to such competitions which hand and, in this particular reference, act debars the young architect from competi to be deeply deplored. Leaders of the a tectural profession are loud in their exh tions for these men to aim at private pra yet they regard with complaisance the ning of certain competitions from which men are automatically ruled out. To pr the youth of any profession or calling enjoying the free exercise of their abi is decidedly unfair at any time. It is more unfair to-day when the establish of an architectural practice is so difficu achievement.

My Association has approached the R.I.

ne suggestion that it should consider est to remove the bar on assistants g certain competitions. It has been d by the R.I.B.A. that it has no to interfere. From the widespread which has followed this statement salaried architect members of the T.A. who are members also of the A. it is hoped there will spring up an nt demand for open architectural com- s which will admit all architects r established in private practice or not, he necessary action is taken. The T.A. will at any rate continue in its ours to attain this object.

JOHN MITCHELL,
General Secretary,
Association of Architects, Surveyors, and Technical Assistants.

ework of the Houses of Parliament.

—Reading about the conference recently ith regard to the stone of the Houses of nent, it has struck me that this problem e got over with a great saving from the l estimate by using "reconstructed " Stone from the quarry where the l stone was obtained could be crushed en mixed with white cement and cast uired shapes. Reconstructed stone is a post-war development, but my ex- e of it is that it has come to stay and sily outlast the natural stone.

F. W.

British Standard Sections.

—In amplification of Dr. Oscar Faber's article in *The Builder*, might I be allowed that the new British Standard Sections designed with a view to giving industry lly a set of sections with a higher nic efficiency than the old ones, and the ections are undoubtedly superior to any in existence. Dr. Faber, in his article, rightly points out that the cases in which w British Standard Beams are preferable old are in the majority, and it is therefore unfortunate that he has laid stress upon omewhat special cases of valuable sites head-room is of such importance that y justify a heavier section of the same . Simplification and standardisation can succeed on broad general lines, and these ns were prepared by a fully representative nittee, including both users and makers lso exporters, so that as far as it was le to do so, all points of view were taken account.

the good of the trade of the country, and cularly the recovery of the steel trade, tects and engineers should now cease to y the old sections and so hasten the nt transition period from the old to the which will enable the rolling mills to roll tock the new sections alone.

C. LE MAISTRE,
Secretary, British Engineering Standards Association.

e Acquisition of Chiswick House and Grounds.

—As an active member of the Resi- Committee formed nine years ago to the Chiswick District Council to press rd the purchase of the Duke's Meadows, re the feelings and comprehend the point of those who are opposing the n of an electricity generating station the Southern Railway line on the part e meadow land near Barnes Bridge. Residents' Committee represented all s of opinion and was elected to promote articular purchase. It was in no sense rty organisation, and became the pre- of the Chiswick Civic Association. C. S. Goldman, M.P., was our chair- Regardless of expense, we provided Member of Parliament with a copy of ndsome brochure dated 1918 and illus- by plans and photographs. Our pro- la instigated the House of Commons to out the Bill introduced by the Gas & Coke Company and drafted to obtain powers to transfer the gas works to the Duke's Meadows. I rejoice that our efforts were crowned with success, and that consequently the District Council completed the purchase of the Duke's Meadows in 1923.

I retired from practice that year, but this does not mean a cessation of activity in furthering, as best I may, the good fortunes of Chiswick. In this matter I cannot join the Jeremiahs. I beg leave to state my reasons, and a few figures will suffice to show that there are other considerations in connection with our parochial open-air amenities and this pleasure grounds question which must not be ignored. The situation has changed owing to the impending opportunity of acquiring in exchange for 45 acres of this undeveloped land the famous and historically equipped property of Chiswick House, including the Earl of Burlington's famed villa designed by John Campbell and William Kent, who completed that building in 1736. The well-wooded grounds comprise 64 acres. Such an unexpected good fortune for Chiswick is of unqualified importance, not only in our day and generation but in the public interest for all time. The alternative to this enterprise would be nothing short of a disaster, which at all hazards must be prevented, otherwise the property will be cut up by a builder's scheme of commonplace streets consisting of small indifferent villas interspersed with dreary blocks of flats.

The financial resources of Chiswick necessitate this tentative adjustment because the combined area of the Duke's Meadows and grounds of Chiswick House amount to 244 acres to be maintained out of the rates. Up to the present some 70 acres on the north-east of the Southern Railway have been laid out as sports grounds and promenades. The Chiswick Polish Company, however, holds 18 acres of this part of the meadow land and will erect a factory thereon, adjacent to the railway. To enable the District Council to secure Chiswick House and its Park it is proposed to allow a generating station to occupy four acres in a corresponding position on the other side of the line where the electricity authority will have a holding of 45 acres. However, ample playing fields westward of an additional 45 acres are to be retained for public recreation.

The polish factory and the generating station are to balance each other, being separated by the high level railway line which will serve to mask both behind the elevated foreshore promenade. The meadows hereabouts being low are subject to tidal conditions. The electrical authority is to bear the cost of continuing the present promenade under the railway and carrying it for a distance of between 500 and 600 ft. in front of the land they are acquiring, and also in addition they are to lay down a lump sum of £6,000 in 1930. The generating station is to be at least 100 yards from the southern boundary of the electricity authority's land, consequently that will be at least this distance (plus the width of the promenade) from the river. Arrangements are in progress with the railway company for sidings to run direct into this new station. The risk of motor lorries being largely employed, as some objectors have foretold, is thus anticipated because the transport will be by railway. The line will continue to serve utilities, but anyhow it disfigures the rural character of its immediate surroundings and does not pretend to suggest a sylvan glade, therefore the site can in no sense be equivalent to the grounds of Chiswick House. Besides, this remotely situated parcel of flat land is difficult to reach from the northern parts of the parish, whereas the grounds of Chiswick House are happily situated close to the centre of the district and of easy access from the High-road by way of the Dukes-avenue, thus linking up the Duke's Meadows further southwards.

The choice has to be made one way or the other in the immediate future. Ealing and Acton already have secured Gunnersbury Park of 2,200 acres. Chiswick surely will not hesitate to emulate this same far-seeing municipal enterprise by accepting the Duke of Devonshire's preferential offer of his mansion and its choice precincts for the good of posterity. To effect this democratic advantage, the unanimous support of the parish will best expedite the transfer and save needless expense every way. When I came to live in Chiswick forty-nine years ago the population was about 10,000. To-day it figures, I suppose, at something like 50,000. Athletic sports and pastimes are essentials for such a community's well-being.

MAURICE B. ADAMS, F.R.I.B.A. (retired).

NORTH OF ENGLAND TOWN PLANNING

MR. REGINALD BRUCE, formerly chief surveyor of the Manchester and District Regional Joint Town-Planning Advisory Committee, on Saturday read a paper on the Committee's scheme at a combined meeting of the Yorkshire and North-western District of the Institution of Municipal and County Engineers and the North of England Division of the Town-Planning Institute. The meeting, which was held in the Town Hall, Manchester, was presided over by Mr. F. Marsden (City Engineer of Bradford).

One of the points strongly emphasised by Mr. Bruce in the course of his paper was that modern social and commercial life demanded that artificial boundaries between districts should be eliminated from the mental vision. There must, he said, be freedom from the petty attitude towards problems that mattered. Local jealousies and prejudices must disappear, and in place of them must be set up the spirit of co-operation and co-ordination. In a phrase, there must be regional thinking.

The scheme covers an area of about 1,100 square miles, embraces 96 constituent local authorities in the counties of Lancashire, Cheshire, Derbyshire and Yorkshire, contains a population of about 3,000,000, and has a total rateable value of nearly £20,000,000. Commenting on the diversified character of the area, the lecturer said that the road system as it existed to-day consisted of a number of roads radiating from Manchester, each one connecting a number of important and contributory centres. Some of the roads were good, and some were bad. The approaches to towns were generally inconvenient, and many bottle-necks existed. There was, for instance, the notable bottle-neck on the Manchester to Liverpool road at Warrington, where an immense amount of traffic passed along a main street only 15 ft. 4 in. wide.

Generally, he said, it was considered that the number of radial roads in the region was sufficient, but all of them would require to be widened and improved. The lack of communications between the north and south was due to the same cause as existed in ancient times —the natural barriers between Cheshire and Lancashire. In devising a new road system for the region the principle adopted was the establishment of a few roads of an arterial character with connecting links between them and all towns and districts in the region, as well as providing direct communication between the various towns themselves.

One of the most important of the suggested roads was known as the East and West Lancashire road. This would enter the region from Liverpool at Billing, proceeding eastward near Ashton-in-Makerfield, between Atherton and Tyldesley, to the north of Worsley, and on to Swinton and Pendlebury. Thence it would proceed in a north-easterly direction by way of Whitefield to the south of Rochdale, and join the road into Yorkshire at Milnrow. Another east and west road suggested was one from Oldham by way of the south of Bury to Bolton.

With regard to north and south communications the most important suggested was that from Bolton and district via Atherton, Tyldesley, and Leigh, to connect to the Warburton high-level bridge, and thence by a new road to join with the existing roads to the south.

AMERICAN APARTMENT HOUSES.—XII

By F. E. BENNETT, A.R.I.B.A.

BEDROOMS AND BATHROOMS.

The sleeping portion of a flat includes bedrooms or "chambers"; dressing rooms; bathrooms complete with bath, w.c., lavatory basin, built-in medicine chest; built-in cupboards or "closets" and the passages.

The sizes of these rooms are:—

Bedrooms.—15 ft. by 17 ft.; 14 ft. by 19 ft.; 12 ft. 6 in. by 18 ft.

Bathrooms.—About 6 ft. by 11 ft.

Closets.—Wide and shallow, to take twenty suits or dresses, and fitted with a boot shelf.

Passages.—3 ft. 6 in. to 7 ft.

The bedrooms and bathrooms are all made to face on outside walls and given a south aspect if possible. The aim is to give each bedroom a bathroom and two closets, so that if there are two occupants there is one for each.

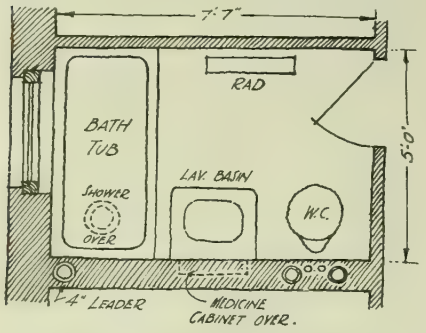

Fig. 42.—Plan of Small Bathroom.

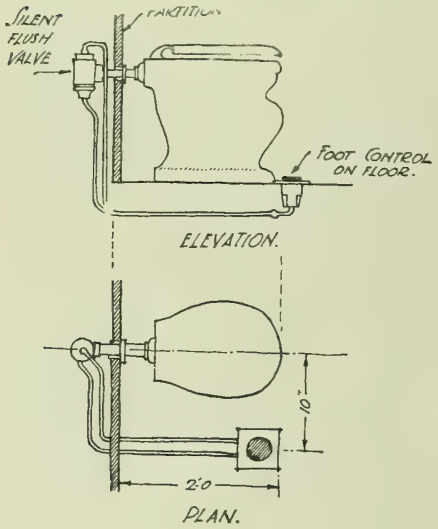

Fig. 43.—W.C. with Push-Button Control and Silent Flushing.

The equipment of bathrooms has reached a very high standard. The walls and wainscot are tile-faced, bath-tubs are "built-in" and fitted with shower equipment over. There are about twelve patterns of bath-tubs standardised by the manufacturers. Five feet to 5 ft. 6 in. is the maximum length even in the very best flats. The reason for their smallness is said to be because some people are frightened of drowning in large ones, and also a p does not need to be totally covered, be the room is warm. For quickness the sh over the bath is more used than the tub.

W.c.'s (Fig. 43) are flushed with "fl meter" or flush valve, the ball-cock flush being now entirely dispensed with. The fl meter valve would not operate with the 1½ maximum flush allowed in England, bu 2½-gall. allowance in U.S.A. makes it pos

THE LONDON SOCIETY

ANNUAL GENERAL MEETING.

The annual meeting of the London Society was held on March 23 at the London Museum, Lancaster House, with Lord Crawford and Balcarres, the President, in the chair.

In moving the adoption of the report, Lord Crawford said that during the year the Society had been faced by two urgent and momentous problems—the London bridges and the City churches. In each case the influence of the Society—which was still growing—had, broadly speaking, been exercised in such a way that its wishes had been realised. The Society interested itself not merely in the preservation of Waterloo Bridge, but in the proper development of traffic by means of other bridges, and the report of the Royal Commission, appointed to some extent on the representation of the Society, had confirmed the views put forward by the Council. It was true that the preservation of Waterloo Bridge in its original condition was not recommended by the Commission. It had been suggested that the bridge should be widened. Waterloo Bridge was, in his opinion, a perfect work of art, perhaps the greatest architectural monument of the nineteenth century. He regretted that it should have to be altered, embellished, or improved, but at least the main lines of that noble structure were to be preserved, and the London Society had taken its due share in that remarkable achievement.

With regard to the City churches, the triumph of the principles of the Society had been complete and uncompromising. He hoped the result would make clear to those in charge of our great historic monuments that the sentiment in favour of preservation was growing, and that the feelings of veneration and respect were becoming invincible. The membership of the Society had risen from 300 to 1,500. He pleaded for more members still, in order that the Council might be able to exercise influential pressure on any question relating to the welfare or amenities of London.

Sir John Foster Fraser, in seconding the proposal, emphasised the need for more people joining the Society. Londoners in the main knew nothing about Greater London; their ignorance was appalling. There were people—mostly from America—who in the course of two or three weeks saw and found out more about London than Londoners did in a lifetime. There was one thing to which the Society might well turn their attention, and that was the preservation of amenities in our streets and parks. He had been recently to Vienna and had discovered there that if a man threw away a piece of paper in the street, the nearest policeman would arrest him, fine him a shilling and make him pick it up and put it in the nearest waste-paper receptacle.

The report was then formally adopted.

Lord Aberconway, proposing the re-election of the Council and officers, said the Society had to take care that the iconoclast did not tamper with our wonderful possessions. The Society ought to have 15,000 rather than 1,500 members.

Sir Edgar Bonham-Carter, seconding, referred to the need of preserving the London squares. As the law stood, a great many of the squares might be built over, for the question of compensation arose in connection with preservation. It had been said that it would not be unfair for Parliament to declare that the squares should be kept as open spaces without compensation to the owners. Into that the London Society might well inquire.

The Council and officers were then agreed to.

The Rev. S. G. Ponsonby, in proposing a vote of thanks to Lord Crawford, said he came there full of gratitude to the London Society for their part in the saving of the City churches. Speaking of the President, he said that the President's activities were well known and that they of the Society were proud to have him as their chairman.

Lord Crawford having expressed his thanks, Sir Cato Worsfold proposed a vote of thanks to the London Museum authorities for the way in which they had allowed the Society to meet in their splendid hall. He then made a plea for the retention of the London Stone in its present position in Cannon-street rather than remove it to the Guildhall, with which it had nothing to do.

Dr. Mortimer Wheeler, the Keeper and Secretary of London Museum, having acknowledged, on behalf of the Museum authorities, the expression of thanks, the proceedings terminated.

MEETINGS

Saturday, *April* 2.

Institution of Municipal and County Engineers.—Executive and Quarterly District Meeting. At the Town Hall, Bradford. 11 a.m.

Monday, *April* 4.

Royal Sanitary Institute.—Mr. A. J. Martin on "Sewage Disposal." At 6 p.m.

The Society of Engineers (Inc.).—Mr. G. C. Workman on "Some Aspects of Reinforced Concrete." At 5.30 p.m.

Wednesday, *April* 6.

Southend-on-Sea and District Society of Architects.—Mr. W. R. Davidge on "Some Aspects of Town Planning." At 8 p.m.

The Liverpool Architectural Society.—Annual General Meeting. At 5.30 p.m. Mr. P. H. Lawson on "Later Renaissance Architecture of Chester."

Institution of Sanitary Engineers.—Messrs. Newport and Danger on "Kingsbury Main Drainage Scheme, 1924–1926." At Caxton Hall, S.W.1. 6 p.m.

Royal Archæological Institute.—Mr. J. W. Walker, on "Recent Excavation of the Priory of St. Mary Magdalene at Monk Bretton, Yorks." At 5 p.m.

Thursday, *April* 7.

Society of Antiquaries.—Ordinary Meeting. At 8.30 p.m.

Friday, *April* 8.

Royal Sanitary Institute.—Mr. W. R. Hicks on "Scavenging, Disposal of House Refuse." At 6 p.m.

Royal Sanitary Institute.—Discussion on "Liverpool Main Drainage System." To be opened by Mr. H. C. Williams, Assistant City Engineer, Liverpool. At University, Liverpool. 5 p.m.

Joint Delegation of the Local (Yorkshire) Associations of the Institutions of Civil, Mechanical, Electrical, Municipal and County and Locomotive Engineers.—Second Joint Delegation Dinner. At Great Northern Hotel, Leeds. 7 p.m.

SOME EFFECTS OF MODERN CONDITIONS ON DESIGN

In the course of a paper on this subject read before the Liverpool Architectural Society on March 23, Mr. Herbert J. Rowse, A.R.I.B.A., having explained that he proposed to consider the larger type of commercial building in preference to a more general discussion, said one of the most important considerations with which we, as architects, were concerned was to provide to the owner an adequate return upon the capital he expended, a problem often difficult of solution under the present conditions of high costs, small output of labour, and comparatively poor organisation of the building industry. If this object was to be achieved it was obvious that the architect who proceeded to design his building with some preconceived idea of architectural composition (he was speaking of external treatment) which necessitated the loss of rentable floor area would find himself in the position of either having to place before his client a scheme which was a failure from the financial view, or he would be obliged to re-design his project in such a way that it satisfied this dominating condition. There were some members of their calling who professed to believe that a fair consideration and knowledge of the financial aspect of their work must cost the artist his soul. That was an attitude which in his view was to be deplored. If we looked backwards we did not find that the great architects of other times limited themselves to a knowledge of their art only. For instance, Wren, whose genius as an artist we all acclaimed, did not despise the knowledge of other subjects.

The higher buildings which were now being built in this country were not occasioned by æsthetic considerations, nor were they coming into being because our cousins in America had erected cities of skyscrapers. These buildings were the direct outcome of the condition to which he had already referred. Site values had advanced, national and civic expenditure had increased, and the cost of any given piece of work was from two to three times as much as it used to be, so that consequently we must, if we were to give the owner the return for which he rightly asks, provide a greater rentable area on a given site than that which had hitherto been necessary. To do this it was obvious we must build heavenwards. He was not advocating the skyscraper as it was known in America, and he thought it was a pity that a building of eight or ten, or even twelve, stories should be so named in this country.

Steel, continued the speaker, was one of the greatest factors in modern building work to-day. The use of steel might in some ways limit the designer, but these limitations were as nothing compared to the immense possibilities which were opened up to him by its use. He was able to think of uninterrupted spaces, the magnificence of which, in size, had hitherto been undreamt of. To make the greatest use of this material as a structural medium we must depart from many of the architectonic precepts which had been handed on to us. This departure might simplify some problems, but it would also assuredly create difficulties the solution of which could not be found in a History of Architecture. We read vague suggestions from time to time that architects of the present day were devoid of creative power for the reason that they did not evolve some new style expressive of our methods of construction, whether steel or concrete. We were told that to use a stone or brick facing to our steel structure was insincere. He would simply ask, "Why should it be so"? Either of these materials did what was asked of it. It protected the interior of the building from the weather and it retained the heat which was generated within, and if the design of the façade was the logical outcome of conditions, then it would in effect express something of the construction which was behind it. In the interests of those financial considerations to which he had already referred, it was necessary that the greatest possible standardisation of the steelwork in a building should be effected. To do this the architect must not only know something of its limitations. In the designing of a plan in which steel was to be the structural material, it was not enough to divide the site into squares or rectangles of such sizes as might be required by the practical considerations of sub-division or lighting, and at the points of intersection to introduce the vertical supports, or, if conditions demanded it, to eliminate some of those supports and to introduce horizontal steel which would do the work of the stanchions which had been omitted. That, he thought, was using this great material without imagination.

In talking of the structural elements of the plan it might not be out of place to mention the rather mundane matter of what he called service shafts, which were necessary in the higher buildings of to-day. These shafts had become essential owing to the ever-increasing number of pipes and electric cables in a modern building. The point might appear to be a small one, but it was not always easy to provide these spaces (which must be continuous from top to bottom of the building) especially in zoned buildings, and to make them integral parts of the architectural conception. We all knew the nightmare these pipes could be to an architect, but here again it was not wholly the æsthetic consideration which had caused these spaces to be provided. Access must be gained to these pipes in high buildings for the same reason that access was necessary in the lower buildings of the past. In the latter case the plumber, for instance, was able to do all that was necessary by the use of a ladder; to-day that was, of course, impossible; hence the use of internal shafts with access at each floor level. This was an example of a practical necessity which, although it might call for the exercise of some ingenuity in its disposition on the plan, had a more than compensating advantage in that, while it provided for the concentration of plumbing and other services in the most efficient manner, it also provided, by freeing the walls of the light court of these pipes, an opportunity to the designer to give some æsthetic expression to those important wall surfaces, the treatment of which was of greater importance in the buildings of to-day, owing to the increased amount of office space which had at its only outlook the walls of the lighting court.

Another modern development which he thought would shortly affect planning to some extent in this country, was the introduction of mechanical equipment in commercial buildings in the form of numerous varieties of machines, the function of which was to economise in labour and reduce routine work to a minimum. This development had already made its influence felt in America, particularly in the great banking and commercial buildings. By the use of this machinery it was now possible to segregate departments which under other conditions would require to be in juxtaposition. To take the instance of a bank: it was now possible to place the principal clerical staff, such as ledger keepers, in a remote part of the building and at the same time to have an equally efficient contact between the counter and the banking public. This condition had resulted in the allocation to the public of more lavish spaces and in some cases the absolute isolation of the tellers from all other sections of the organisation. From the point of view of construction the effect of the introduction of this machinery and the general tendency to desk lighting was equally interesting. The working out of the various problems which resulted had caused the introduction of complete systems of under-floor ducts to accommodate the necessary wiring. To provide proper space for these systems considerable change has been caused to floor sections.

In modern work it was essential in the interests of economy, that the greatest possible speed in building should be attained, noticed in his investigation of American that the efforts made in this direction resulted in a much lower standard of than that which we set for ourselves.

In conclusion, the speaker referred application of the word "modern," whic given to it by some of their brethren claimed that the architecture of our tim indefinite and lacked the spirit of the p state of our civilisation. These gentleme us that we should speak in a new lan but it was not always clear that thoroughly understood the alphabet whic been handed on to them. Some of the crit of present-day buildings which were w by the protagonists of this theory dealt with elevational design. He supposed th so because it was somewhat easier to about this side of architectural work. might imagine after reading these criti that the external treatment of a bu represented the only part of that bu which was of any interest to the arch He held the view that any building of which in planning and design was the l outcome of the conditions which had gov it could be called "modern."

The lecturer illustrated his paper w number of lantern slides of the Cunard ing in New York, by Mr. Benjamin W Morris; the Bowery Savings Bank, New by Messrs. York & Sawyer; the Bank of pool and Martin's, Ltd., by himself; an Greenwich Savings Bank.

EARLY CHRISTIAN EUROPE

Sir Banister Fletcher, V.-P.R.I.B.A., recent lecture at the Central School of and Crafts, dealt with Early Christian chu in Ravenna, Torcello, Sicily, Egypt, Syria the Near East. After the Peace of the Ch he said, the great early Christian bui epoch through the Roman Empire bega the fourth century. The building activi the world passed from the hands of em builders into the hands of church builders all the provinces of the Roman Empire, ju there were built fora, camps and a theatres, so there were found the remai these basilican churches in Syria, in E and in England. In plan and constru these churches were Roman; in detail decoration they were largely Byzantine, b purpose and spirit they were entirely essentially Christian.

The position held by the city of Ra both historically and geographically, mad an important factor in Early Christian tecture. Here were beginnings of things became important elements in mediæval c architecture and formed a most fasci study. St. Apollinare Nuovo had a ci tower, which was the first of that long of campanili or bell towers attached to chu which took the place of the wandering sengers who, with their handbells, calle faithful to prayers. This was another ins of an old form adapted to a new purpose thus the Early Christians evolved the tower from the fortified watch-tower wi look-out. Here, too, was the dosseret above the capital, which was ultimate change the concave classical capital int rounded Byzantine capital.

The Ludgate Bridge.

The Bridge House Estates Committee had before them the scheme of the Royal mission which recommends (so far as th is concerned) the abandonment of a bri St. Paul's and the substitution of a bri Ludgate, in conjunction with an offer the Government to contribute 50 per c the cost of the approaches should the C tion build the bridge in the suggested po The whole matter has been referred to committee for inquiry and report.

SOCIETIES AND INSTITUTIONS

SOUTH WALES INSTITUTE OF ARCHITECTS.

he annual dinner of this Institute was held he Whitehall Rooms, Park Hotel, Cardiff, Thursday, March 24. The President (Mr. F. Ward, F.R.I.B.A., Newport) was sup- ed by the Lord Mayor of Cardiff, Mr. Guy Dawber, P.R.I.B.A., Sir Clement och-Cooke, M.P., and Messrs. H. J. bert (President of the Newport Master ders' Association), C. F. W. Dening sident, the Bristol Society of Architects), C. Lawrence, R.W.A. (President, the sex Society of Architects), E. W. King sident, the National Federation of Build- Trades Employers), Ian MacAlister, J. D. son (Secretary of the Swansea Master ders' Federation), D. W. Selby (President, Cardiff Association of Building Trades' ployers), I. J. Chorley (President of the h Wales Branch of the Institute of ders). There were also present Principal Coles and Messrs. J. A. Hallam, D. Pugh- es, Ivor Jones, T. Alwyn Lloyd, Ll. gan, N. Moss, H. Teather, Percy Thomas, J. M. Willmott, and many others.

ir Clement Kinloch-Cooke, M.P., in sub- ing the toast, "The Royal Institute of ish Architects and the Allied Societies," he had had the good fortune, in a ballot, ecure a place for the Bill for the Registra- of Architects. He regarded it as a just —a national measure which should go on Statute Book. The Bill would not inter- with anyone at present in bona-fide prac- as an architect. All bona-fide architects, ther practitioners or assistants, would e on to the register and none of them ld be deprived of any rights they now oyed. The main object of the Registration was ostensibly the protection of the public, rovided that any person desiring to practice an architect should be required to furnish self with credentials carrying with them utory authority and showing that he had ived the necessary preliminary training and sed the necessary examinations. The same hinery that gave protection to the public ld also protect the qualified architect from competition of the unqualified person. By rocess of elimination the profession of archi- ure would be saved from the risk which at sent assailed it—that of being placed in an lignified position by the wrongful acts, ther due to want of knowledge or other- e, of persons describing themselves as hitects, but who neither by training nor cation were qualified for the work they themselves out to undertake. The wonder him was that so useful and desirable a rm had been so long delayed, and he had ry confidence that the Bill would be placed the Statute Book.

Ir. E. Guy Dawber, F.S.A., in responding, the Allied Societies were the life-blood backbone of the Institute. The Institute done valuable work within recent years furthering the art of architecture and in cation. He was confident that in the near ire they would have a school of architects a style of architecture of which they would e every reason to be proud. Cardiff had excellent school of architecture, and he no doubt it would continue its work with reasing results. Cardiff stood out above all es for its magnificent buildings in Cathays k—buildings unique not only in this ntry but in the world, and they should be inspiration to the South Wales Institute of hitects.

Major Harry Barnes, F.R.I.B.A., em- sised the need and importance of the Regis- ion Bill, and complimented the South les Institute of Architects on the part they taken in connection with it. The appre- sions and opposition of the master builders reference to certain clauses had, he said, overcome. Architecture was not a closed ession; their sole purpose was to make it ducated and trained profession, to provide pen path, from the bottom to the top, for all with ability and energy. Steps were being taken to lift the profession to the same plane as the other great professions, such as law and medicine, which ministered to the public service.

The President (Mr. C. F. Ward, F.R.I.B.A.), submitting "Our Guests," said civic pride had made Cardiff a beautiful city. The members of the Corporation took a keen and practical interest in education, and that was reflected not only in the School of Architecture and the Technical College generally, where Principal Coles was doing valuable work, but in other directions. A well-founded civic society, imbued with the right spirit, was capable of rendering great public service, especially in combating the desecration of the countryside.

The Lord Mayor said one of the speakers seemed to attach more importance to the architecture of the city than to the docks. But for the docks, shipping and industry generally, they could not have had such fine architectural buildings.

The Lady Mayoress also responded.

Mr. E. W. King, F.I.O.B. (President of the National Federation of Building Trades Employers), referred to the good relations between the architects and the building trades, and Mr. G. C. Lawrence, R.W.A., F.R.I.B.A. (President, the Wessex Society of Architects), illustrated the open character of the profession with instances of poor boys being assisted in their careers.

DEVON AND CORNWALL ARCHITECTURAL SOCIETY.

The annual meeting of this Society was held on Saturday, March 26, at Deller's Café, Exeter. The chair was taken by the President, Mr. E. F. Hooper, L.R.I.B.A., of Exeter. Among those present were Messrs. Percy Morris, F.R.I.B.A., A. H. Ough, F.R.I.B.A., R. M. Challice, L. F. Tonar, L.R.I.B.A., E. Jenkin, L.R.I.B.A., Philip Tilden, H. Alban Peters, A.R.I.B.A., B.Arch., O. Ralling, L.R.I.B.A., John Bennett, L.R.I.B.A., W. J. M. Thomasson, A.R.I.B.A., J. C. Beare, A.R.I.B.A., W. F. R. Ham, D. W. Cooper, N. B. Irwin, J. T. Harriman, E. C. Oaks, F. J. Sutton, D. W. Salter, H. W. Merrifield, E. Hargreaves, E. L. R. Vining (Honorary Member), and J. Challice, A.R.I.B.A., Hon. Secretary (Exeter District); and Messrs. A. C. Norman, F.R.I.B.A., B. Priestley Shires, F.R.I.B.A., A. B. Parker, F.R.I.B.A., Chas. Cheverton, F.R.I.B.A., H. Victor Prigg, A.M.I.C.E., P. O. G. Wakeham (Plymouth District).

The President, in opening the meeting, expressed satisfaction with the excellent attendance and read apologies from members who were unavoidably absent. The minutes of the preceding annual meeting, and of the special general meeting held at Torquay on September 25, 1926, were read, confirmed and signed by the President. The annual report and balance-sheet of the Society were presented and unanimously adopted. The annual reports and balance-sheets of the Exeter and Plymouth branches were also presented and unanimously adopted. The prizes for the annual measured drawings competition were awarded to Mr. F. Podesta Harrison (Plymouth) and Mr. F. S. Stillwell (Plymouth).

Mr. E. F. Hooper, L.R.I.B.A., then delivered his address, in the course of which he mentioned that the membership of the Society at its inception in the year 1888 was very small, but had increased to a present membership of 134. The design club, formed last year, had received considerable help and sympathy from the University College authorities. It was possible that at some future date a fully recognised architectural school would be in existence as a part of the University of the South-West, which would enable architectural students in the West to obtain the training necessary for passing the examinations of the R.I.B.A. The Registration of Architects Bill, which was to be presented before Parliament next month, was a measure of very great importance to all architects, and there was no possible doubt that the measure, if passed, would be of inestimable value and benefit to the public and to the civic life of the country in general. In conclusion, the President mentioned the growing concern of the public at the spoliation of the countryside by ugly and unsuitable buildings, and lamented the fact that architects were not consulted to any great extent in connection with the erection of small houses.

The following officers and Council were elected for the ensuing year:—President, A. C. Norman, F.R.I.B.A. (Plymouth); Vice-Presidents, R. M. Challice (Exeter), W. A. Vercoe, A.R.I.B.A. (Plymouth); Past-Presidents, J. L. Fouracre, F.R.I.B.A. (Plymouth), E. F. Hooper, L.R.I.B.A. (Exeter); Hon. Treasurer, S. Dobell (Exeter); Hon. Auditor, L. F. Tonar, L.R.I.B.A. (Exeter); Hon. Secretary, J. Challice, A.R.I.B.A. (Exeter); Members of Council, Fellows P. Morris, F.R.I.B.A., J. Bennett, L.R.I.B.A., W. J. M. Thomasson, A.R.I.B.A., O. Ralling, L.R.I.B.A., E. Jenkin, L.R.I.B.A. (Exeter), J. C. Beare, A.R.I.B.A. (Newton Abbot), Chas. Cheverton, F.R.I.B.A., A. S. Parker, F.R.I.B.A., B. Priestley Shires, F.R.I.B.A., W. H. May, F.R.I.B.A., H. Victor Prigg, A.M.I.C.E. (Plymouth); Associate Members of Council, D. W. Cooper (Exeter) and A. T. Martindale, L.R.I.B.A. (Plymouth).

Following the business of the meeting, Mr. Philip Tilden addressed the members on the pressing need for the co-operation of architects with the Council for the Preservation of Rural England. He gave several instances of cases where demolition of ancient and historic buildings had been carried out without regard to their æsthetic value, and urged members of the Society to do all in their power to interest the public in the preservation of old and beautiful buildings. The speaker mentioned that the collapse of part of the Exeter city wall had aroused much interest throughout the country, and the hope was generally expressed that the City Council would give very earnest consideration to the rebuilding and preservation of the wall.

A motion was put before the meeting and unanimously carried that a letter be sent to the Exeter City Council asking that the wall be rebuilt and preserved.

Before the close of the meeting a hearty vote of thanks was accorded to the retiring President for his valuable work and untiring devotion during his year of office. The members afterwards visited places of interest in the city.

Visit to Bell Foundry.

The Art Standing Committee of the R.I.B.A. have accepted the offer of Messrs. Gillett & Johnston to conduct a party of members and their friends over their works at Croydon, on Saturday, April 2. The world's largest carillon, namely, 53 bells, and the largest or bass bell weighing 10 tons for the Canadian Houses of Parliament, at Ottawa, will be on exhibition, and recitals will be given by leading carillonneurs. The big carillon for Princetown University, U.S.A., the re-cast bells for Coventry Cathedral, and the great electric clock for Ottawa will also be on view. Members will meet at the Foundry at 2.30 p.m. It is situated in Union-road, off Whitehorse-road. Members of the R.I.B.A. and other architects who wish to take part in this visit should apply to the Secretary, R.I.B.A., for tickets.

Sir Whitworth Wallis's Estate.

Sir Whitworth Wallis, Red Walls, Stratford-on-Avon, for over forty years Keeper of the Birmingham Museum and Art Gallery, left £19,768, net personalty £8,975. He gave to the Birmingham Art Gallery three pre-Raphaelite paintings, "Spring," "Summer," and "Autumn," by his father, George Wallis.

The May Fair Hotel.

It is little more than two years ago that Devonshire House and its gardens were in existence; but its glories had departed, leaving only memories of its great past and much speculation as to its future. It seems almost impossible that so great a change can have been achieved in such a short space of time, as a visit to the site to-day shows, for, at an expenditure of millions of pounds, three huge buildings now stand completed, equipped and occupied, upon the site of the old house and gardens, giving this portion of Mayfair a fresh interest and a promise of renewed vitality and prosperity. The first of these three buildings is the new Devonshire House, a fresh expression of architecture, and full of interest. The second is the new home of Messrs. Cook's, and the third is the appropriately-named "May Fair Hotel."

The illustrations which we give this week show what a complex problem the designers of a modern "luxury" hotel have to deal with, and the architects in this instance have been fortunate in having clients who appreciated the unique position of the site, for whilst every foot of the acre of ground covered by the building has been called upon, they have not sacrificed light or air to any part, owing to the generous development of the planning, not always allowed upon such a costly site. The wide, open courts between the wings of the building not only give abundance of light and air, but ensure quiet bedrooms and a pleasing outlook upon the hotel roof garden—which will be gay with flowers—and over the old garden of Lansdowne House and Berkeley-square.

The hotel has three frontages: that with the main entrance is to Stratton-street; the restaurant and ballroom entrances are in the much-widened Berkeley-street; and the third frontage faces across Lansdowne House Gardens to Berkeley-square. The elevation to Berkeley-street is 220 ft. long and rises six stories above the street level; that to Stratton-street is 232 ft. long and eight stories in height.

The two lower stories are faced with stone, the next four with small, dull red bricks, and the crowning stories are again in stone. The design is based upon Georgian work and detail and depends upon proportion and mass for its effect. The fenestration was governed by the internal requirements and the large number of rooms of equal importance which had to be provided for above the ground-floor level, and the planning desired by the owners allowed but few "breaks" in the long fronts for architectural effect; but the massive main cornice is a good crowning member to the Berkeley-street front and the additional stories to Stratton-street provided the opportunity for a feature in the treatment of the upper part, which is also crowned with a bold cornice rising to 86 ft. above the pavement level.

The requirements of the interior have further been expressed externally in the simple Georgian sash-barred windows, indicating the "domestic" rather than the "public" nature of the building. Visitors upon entering the building will probably feel, instead of the austerity and cheerlessness of the usual big hotel, the friendly atmosphere of a fine town house, furnished and decorated in good taste. There are 600 sitting-rooms, bedrooms and bathrooms in the hotel, and many are arranged to provide self-contained suites of rooms with inner corridors approached from the main corridors.

We cannot here describe in detail the schemes of decoration of the reception rooms, ballroom and bedrooms, the comforts and conveniences which have been provided, nor the elaborate kitchens, &c., but the plans and photographs we publish give some idea of their completeness, although colour is required to convey the real effect of the building. All the furniture, fittings, carpets, &c., have been specially designed for the building and are all of English make.

The hotel will be under the management of the Gordon Hotel Company, and Sir Francis Towle, the managing director.

The chief contractors and engineers, Messrs. Edcaster, Ltd., of No. 147, Grosvenor-road, London, S.W.1, and of Doncaster, who were responsible for the building, the sanitary work, electric lighting and heating and ventilation, are to be congratulated upon the excellent manner in which their work has been done and also upon the fact that, notwithstanding the coal and other strikes, the work has been completed within the time stipulated.

Mr. A. O. Edwards, the firm's managing director, has been assisted by their building manager, Mr. R. H. Woolgar. Mr. C. E. Muggeridge with Mr. T. L. Vesper (who, we regret to record, died in December, 1926), were responsible, on behalf of the Hotel Company, for the decorations, furnishings and fittings. Mr. Whitmore Robinson and Mr. V. C. Hardy were responsible, with Messrs. Edcaster, Ltd., for the lighting, heating and ventilating schemes. All the principal rooms have a system of flood lighting in addition to fittings for standard and bracket lights. The heating and ventilation is upon the "Plenum" principles, the fresh air being washed at its entry to the building, heated and forced through, and the vitiated air extracted by electric fans.

The hotel has been erected from the designs and under the supervision of Mr. W. Henry White, F.R.I.B.A., and his son, Mr. Theodore Hansford White, A.R.I.B.A.

[For list of contractors, see page 526.]

R.I.B.A. Problem in Design.

In connection with this design we have received from the Board of Architectural Education the following notes by Mr. W. E. Vernon Crompton, F.R.I.B.A.:—

"The design for a maternity and child-welfare centre illustrated has been selected from sixty-one designs sent in by various students. On the whole the design has been well thought out, and would be found to be convenient and workable. It is fairly economical and inexpensive, whereas nearly all the designs sent in suffer from over-elaboration in detail, which is not sensible, seeing that the funds available for such a building invariably call for the strictest economy.

"In the design illustrated the offices are properly placed near the entrance, with the nurses' room in a position admitting of good supervision. It would probably have been better if the planning of this portion could have been reversed so as to bring the dispensary nearer to the mothers' entrance, which will also be used as the exit. There is too much lavatory accommodation. Part of this space might more properly be used for storage, especially of linen, of which ample supplies are required. The arrangement for the perambulators is somewhat generous but well conceived, and can be supervised without special addition to the staff.

"Although not mentioned in the conditions, a surgery and sterilising room are almost essential. The space occupied by the doctors' and weighing-room adjoining the dispensary is the best position for this, and a portion cut off from the perambulator space adjoining the buffet would find room for the doctors' and weighing-room. We are inclined to think that the long narrow corridor giving separate access to the doctors' and other rooms is somewhat of a luxury.

"In many of the designs sent in, the ha is surrounded entirely by rooms. The op end giving on to the loggia and garden in t design illustrated is quite an important an pleasing point. The buffet will not only used by the mothers while waiting or aft the examination of the children, but as t nurses are in attendance during the whole the day it will also be used by them for mid-day meal. The buffet ought therefore have been planned in greater detail, wit kitchen and scullery, etc.

"The lavatory accommodation used in con nection with the hall seems a trifle excessiv The design generally is appropriate. W think, however, that if the eaves of the stree elevation had been carried through and no broken by a central feature the design woul have been improved."

St. John the Evangelist, Warminster: The New Baptistery.

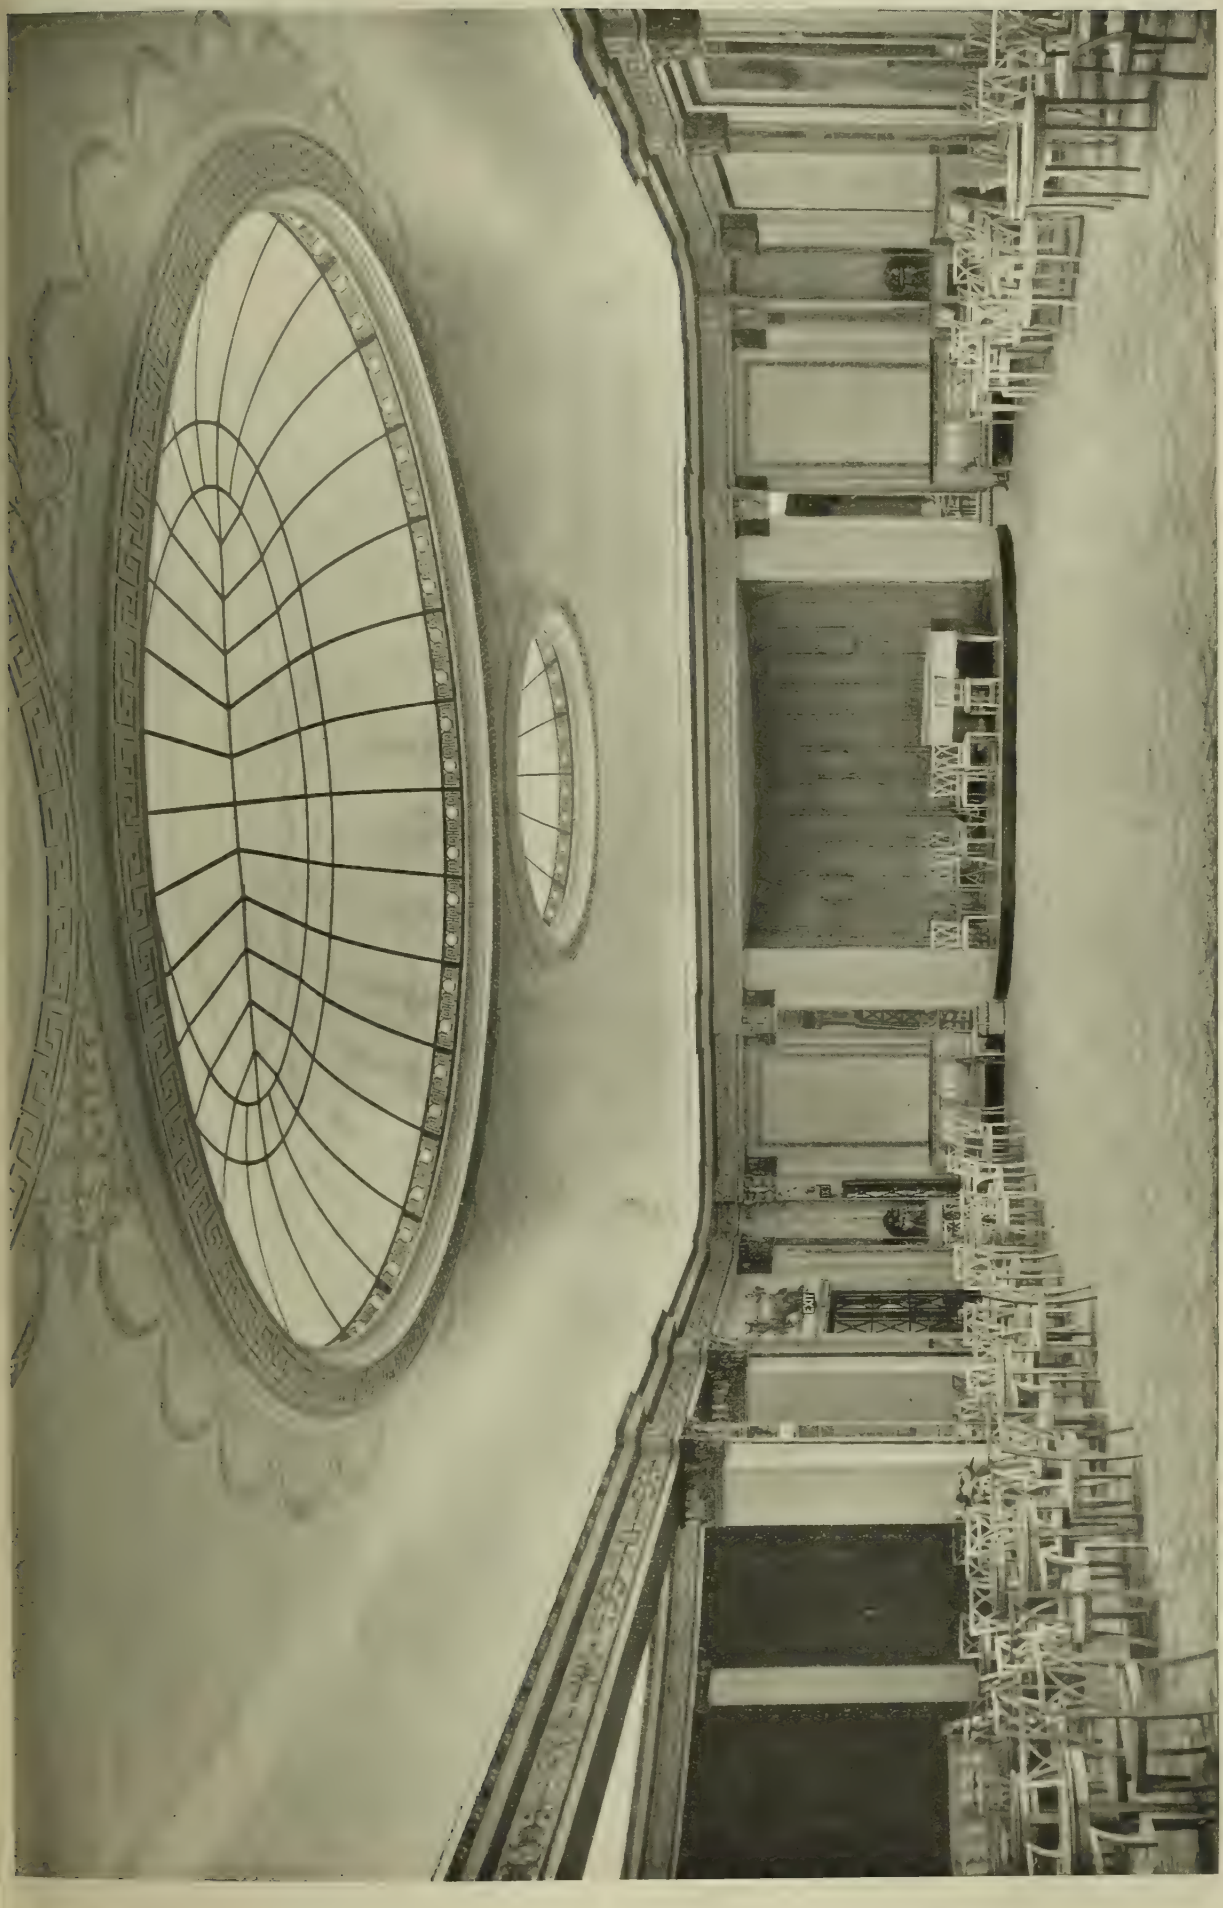
The original design for this baptistery wa made some twelve years ago by Mr. C. E Ponting, F.S.A.—then the Diocesan Surveyor It was intended by the donor to provide fo the work in her will, but at an advanced ag she determined to carry it out during he lifetime, with the result that it was duly erected and was dedicated on St. Matthew Day, 1926. The church itself was built from designs by the late G. E. Street, R.A., and it was felt that the new work should harmonise with the somewhat severe Early English character of his work. As it was decided to construct the baptistery at the west end, an apsidal form was adopted with a semi-conical stone roof, which lent itself better to the somewhat low structure necessitated by the restricted level of the sill of the west window. An arch of the same detail as the others in the nave of the church was formed under this window, and the general design had to conform to these limitations. The inside of the enclosing wall is divided into five bays by attached shafts from which spring the moulded ribs of the pointed stone vaulting, gathering together at the centre of the semi-circle, the intention being to accentuate the appearance of height as much as possible. The springing of the ribs was therefore kept low down, and the "webbing" of the vault strikes the outer wall in the form of an acutely pointed arch under three bays of which occur double lancet windows on the inside face—and cusped on the outside. The inside sill is continued round as a string, and the wall below this is carved in a flat raised diaper pattern. The walls are 2 ft. 3 in. thick, faced on the outside with hard rubble to match the church and having two pilasters with attached shafts on each of their angles. The gutter is of stone with a corbel table beneath.

The whole of the outside dressings are of Coombe Down stone from St. Winifred's quarry, the gutter and roof stones having been specially selected for hardness. The inside dressings, facing, and vault are of Monk's Park stone. The baptistery is paved with black and white marble to a cheque pattern with a black margin, over the centre of which the old font has been fixed. The roof and gutter were dressed with petrifying stone liquid, and the gutter lined with lead having outlets with shoots at the pilasters.

The windows are glazed with plain leaded quarries of clear glass and have wrot-iron saddle bars and stanchions. The whole of the work has been carried out by Messrs. George Mannings & Sons, of Claverton Down, Bath, under the direction of Mr. Ponting.

The following inscription is inscribed on the north jamb of the main arch:—

To the Glory of God
this Baptistery was given by
Francis M. Rule,
and was dedicated on
September 21st, 1926.



Flats, Southampton.

We illustrate this week a further group buildings in this housing scheme, a section which was given in our last issue. Mr. Herbe Collins is the architect.

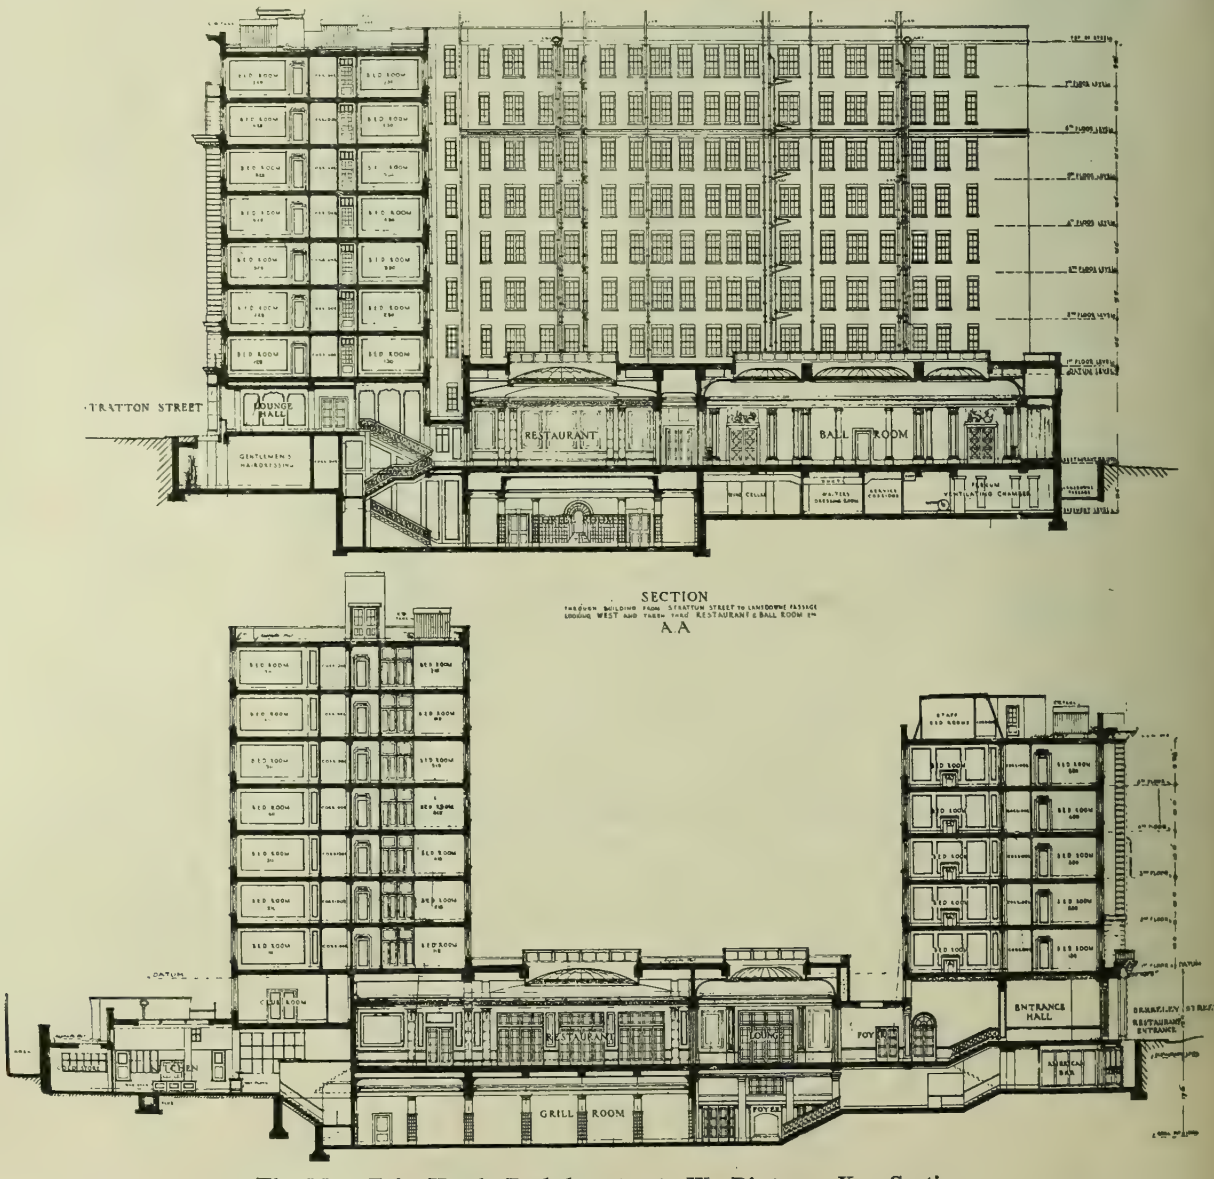
B. Colman & Sons, Ltd., revolving doors; Bostwick Gate and Shutter Co., Ltd., architectural metalwork and collapsible gates.

THE CANADIAN HOUSES OF PARLIAMENT

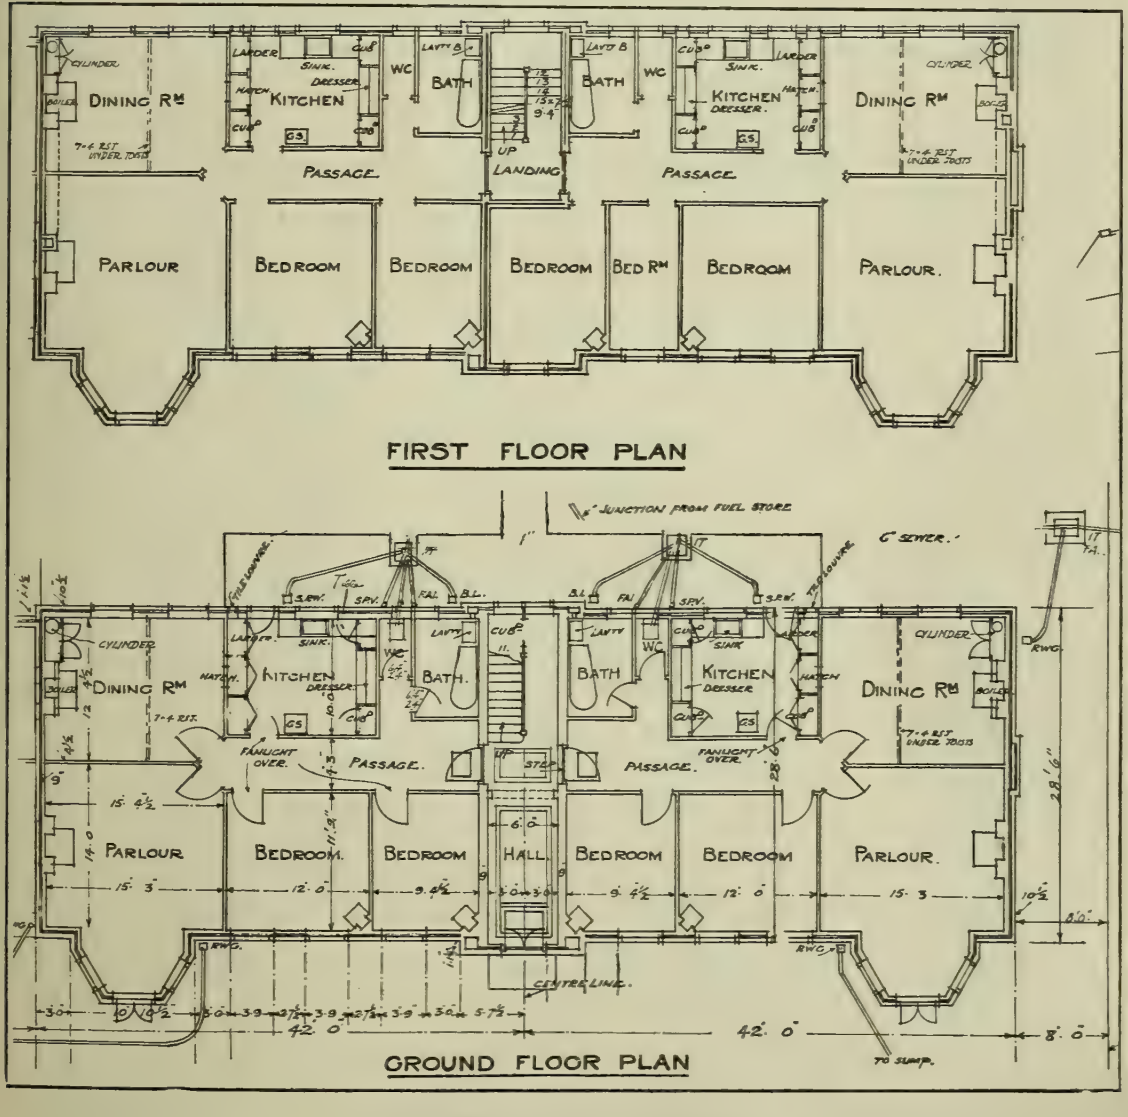


RATHER more than a year since we referred to the carillon made for the Park Avenue Baptist Church in New York by Messrs. Gillett & Johnston, of Croydon, and now the Croydon firm have completed another similar set of bells for the Canadian Houses of Parliament at Ottawa, save that the latter carillon is a little heavier, the Bourdon weighing 10 tons, which makes it one of the largest bells in existence; actually, it is the second largest bell in Canada, and the third for the American continent. The total weight of the carillon is 53 tons, and the steel framework and fittings amounts to another 22 tons.

It seems strange that so far there is nothing in this country to compare with these carillons, although the Croydon bell foundry appears to be able to produce them for our friends abroad. The home of the carillon would appear to have been originally in Belgium, but the art of tuning the bells upon which the success of carillon ringing depends, is the special contribution of Croydon. A bell, like many other noise-producers, is a most complex vibrating instrument, and whilst some bells are in tune with themselves, it is quite another matter to produce whole sets that are in tune with each other as well. These bells destined for Ottawa have been tuned to "International Pitch," and to the scale of "equal temperament," and thus these 53 bells open up a very large field for musical genius. The bells are mounted in a large steel frame, and the hammers are connected to the "Console," where the keys—in reality large levers—are arranged in two tiers in the familiar way of th "white" and "black" keys on the piano an organ, whilst, like the latter, there are peda arranged for manipulation by the feet. Unlik the organ, there are not any draw-stop knob combination pistons or pedals; it would there fore appear possible for an ordinary organist t find out readily how to manipulate thes carillons. The chief difference is that the key have to be struck much harder, and that a chor of three notes or an octave requires both hand Whilst watching the performer, M. Kami Lefevere, we wondered what are the possibilitie of some form of pneumatic mechanism betwee the artiste and bells; it would save muc muscular exertion,

The bells are exceedingly clean castings, an are a credit in every way to the Croydon foundry whilst the "Clavier" has been very carefull worked out in all its detail.

In addition to the bells, the firm have mad the clock, which (by means of electric trans mission) has been built in three separate units the going train operating the dial work; and th striking train, with the "quarter" train, ar some 50 ft. below, under the bells. The old fashioned weights are displaced by electri motors operating the bell-hammers, through suitable train of gears, within the case of th "quarter" train a suitable set of cams. Th quarter chimes are the well-known "West minster," and the clock has four dials, each 15 ft. 9 in. diameter.



A series of receptions at the Croydon work will take place daily until April 8, so that th beauties of this carillon will be in part known t a wide circle of those interested in bells.

THE LONDON BUILDING ACTS AND THEIR APPLICATION.—XII

By H. V. MILNES EMERSON, A.R.I.B.A.

8. Walls are deemed to be divided into distinct lengths by return walls and the length of every wall is measured from the centre of one return wall to the centre of another provided that such return walls are external party or cross walls of the thickness required under this Schedule and bonded into the walls so deemed to be divided.

Note.—A minimum length is not given for the return walls, &c., therefore a break or return of an external wall of whatever length would comply with section.

9. Unless with the consent of the Council every wall other than a wall carried on a bressummer shall have footings :—

The projection of the bottom of the footing of every wall on each side of the wall shall be at least equal to one half of the thickness of the wall at its base unless an adjoining wall interferes in which case the projection may be omitted where that wall adjoins and the diminution of the footing of every wall shall be formed in regular offsets and the height from the bottom of such footing to the base of the wall shall be at least equal two thirds of the thickness of the wall at its base.

Note.—Section 87 gives the District Surveyor power to allow the omission of footings on one side of the wall if built against another wall.

[See note to Item 1 of this schedule relating to footings.]

Where no adjoining walls exist the footings must project on either side. Thus if the edge of your foundation is adjoining your boundary the wall face will be 8½ in. or more away from your boundary. The adjoining owner afterwards builds in a similar way with the result that a space of 17 in. or more is left between the two buildings for the accumulation of rubbish, &c., in course of time. It would be better when building against the boundary (in the absence of adjoining wall) to allow the footings to project on one side only, the bottom course to be twice the width of the base of the wall. Properly constructed the work would be just as strong as if carried out in the traditional manner. For argument, if you build against an adjoining wall, and that adjoining wall is afterwards removed and not rebuilt, the Act does not order you to increase the width of your concrete or brick footings, and if it had to be done the increased width could only be made on one side assuming that you could not obtain the right to encroach upon the adjoining ground.

10. This provides for the underpinning of walls to be executed to the satisfaction of the District Surveyor.

11. A wall shall not be thickened except after notice served on the District Surveyor of the intention to thicken and the thickening shall be executed with brick or stone work in cement properly bonded to the old work to the satisfaction of the District Surveyor.

Note.—Generally the thickening of walls does not exceed half brick, and such a wall bonded to the old wall every fourth course would be reasonable.

PART I.

This part of the first schedule deals with the thickness of walls in buildings not public and not of the warehouse class.

External and party walls shall be of not less thickness than the thickness hereinafter specified in each case. Then follows the various thicknesses required.

It should be noted that "if any storey exceeds in height 16 times the thickness prescribed under this Schedule the thickness of each external and party wall throughout such storey shall be increased to one sixteenth part of the height of the storey and the thickness of each external and party wall below that storey shall be increased to a like extent but any such additional thickness may be confined to piers properly distributed of which the collective widths amount to one-fourth part of the length of the wall."

The height of storeys without increasing the thickness of the walls would be as follows :—

Thickness of walls.	Height of storey.
8½ in.	11 ft. 4 in. (limit 10 ft.)
13 in.	17 ft. 4 in.
17½ in.	23 ft. 4 in.
21½ in.	28 ft. 8 in.
26 in.	34 ft. 8 in.

Item 11 of this part provides that "no storey enclosed with walls less than 13 in. in thickness shall be more than 10 ft. in height between the floor and the ceiling thereof or between the floor and the tie of the roof."

Item 12.—All buildings excepting public buildings and such buildings as are in this Act defined to be buildings of the warehouse class shall as respects the thickness of their walls be subject to the provisions contained in this Part of this Schedule.

PART II.

This part of the schedule deals with buildings of the warehouse class :—

Walls up to 25 ft. high (whatever the length) to be 13 in. thick.

Walls up to 40 ft. high and 35 ft. long to be 13 in. thick.

Walls higher or longer to be of the thickness given at the base and to comply with the following item 11 :—

The thickness of the wall at the top and for 16 feet below the top shall be 13½ in. and the intermediate parts of the wall between the base and 16 ft. from the top shall not be of less thickness than would be the case if the wall were to be built solid throughout the space between straight lines drawn on each side of the wall and joining the thickness at the base to the thickness at 16 ft. below the top.

Nevertheless in walls not exceeding 30 ft. in height, the walls of the topmost storey may be 9 in. thick provided the height of that storey does not exceed 10 ft.

Note.—It should be observed that the thickness of the wall for 16 ft. below the top is 13½ in. instead of 13 in., and 9 in. instead of 8½ in. as previously specified.

Item 12.—If in any storey of a building of the warehouse class the thickness of the wall as determined by the provisions of this Schedule is less than one-fourteenth part of the height of such storey, the thickness of the wall shall be increased to one-fourteenth part of the height of the storey and the thickness of each external and party wall below that storey shall be increased to a like extent but any such additional thickness may be confined to piers properly distributed of which the collective widths amount to one-fourth part of the length of the wall. The height of storeys without increasing the thickness of the walls would be as follows :—

Thickness of Walls.	Height of Storey.
9 in.	10 ft.
13½ in.	15 ft. 9 in.
17½ in.	20 ft. 5 in.
21½ in.	25 ft. 1 in.
26 in.	30 ft. 4 in.
31 in.	36 ft. 2 in.

Walls over 60 ft. high and more than 45 ft. long are increased in thickness from the base up to within 16 ft. from the top of the wall by 4½ in. (subject to provision of piers).

See 3, Miscellaneous.

Item 13.—This provides for thickness of walls built of materials other than those before specified.

Miscellaneous.

Cross Wall.—1. The thickness of a cross wall shall be two thirds of the thickness hereinbefore required for an external or party wall of the same dimensions and the same class of building but never less than 8½ in. and no wall shall b deemed to be a cross wall unless it is carrie up to the floor of the topmost storey and unles in each storey the aggregate extent of the vertica faces or elevations of all the recesses and tha of all the openings therein taken together doe not exceed one-half of the whole extent of th vertical elevation of the wall.

Note.—One half of the total area of a cros wall must be of the full thickness required This must not be overlooked as the cross wa might govern the thickness of the exterior o party walls.

2. Wherever a cross wall becomes in an part an external wall such cross wall sha be of the thickness required for an external wa of the same height and length and belonging t the same class of building.

3. Where an increase of thickness is by an rule of Part I or Part II of this Schedule require in case of a wall exceeding 60 ft. in height an 45 ft. in length or in case of a storey exceedin in height 16 times or 14 times (as the case ma be) the thickness prescribed for its walls o in case of a wall below such storey the increase thickness may be confined to piers properl distributed of which the collective width amount to one-fourth part of the length of th wall.

Incorporated Church Building Society.

At a meeting of the Incorporated Churc Building Society, held at 7, Queen Anne's-gate Westminster, last week, the Hon. Sir E. P Thesiger, K.C.B., in the chair, grants wer made towards building new churches at Drypool S. Columba, £300; Kettering, All Saints, £200 and Romford, S. John-the-Divine, £150. To wards repairing the churches at Arnesby S. Peter, £25; Cookham, Holy Trinity, £50 Drypool, S. Andrew, £75; Earl Stonham S. Mary, £10; Gnosall, S. Lawrence, £50 Grimoldby, S. Edith, £25; and Walworth S. Peter, £100. The following grants were als paid for works completed at Bitterne Parl The Ascension, £100; Bratton, S. James-th Great, £30; Bristol, S. Paul, £100; Came West, All Saints, £50; Cann, S. Rumbold, £10 Harty, S. Thomas, £10; Hittisleigh, S. Andrew £25; Islington, All Saints, £50; Loxto S. Andrew, £40; Llanarmon-yn-Ial, S. Garmo £75; Northfleet, S. Botolph, £150; Puddingto S. Thomas-a-Becket, £20; S. Helens' Paris Church, £350; Southwark, S. Peter, £2 and Westcliff, S. Michael and All Angels, £35 In addition to the above, the sum of £817 w paid towards the repairs of twenty-seve churches from trust funds held by the society.

British Standard Specification.

The British Engineering Standards Associ tion have recently issued a specification f switchgear cells and cubicles constructed moulded stone (B.S. Specification No. 26 1926). It is divided into two parts indicatin the principles to be followed in the constru ton of: (1) Cubicles constructed from p cast units; (2) cubicles constructed in pla

It defines the terms "concrete," "slabs and "mouldings," and indicates t materials to be employed and method mixing in the preparation of "concrete It defines the finish of "slabs" a "mouldings" and lays down acceptan tests to be made at periods from 4 to weeks in the age of the slabs. In the c of mouldings, tests are to be taken on sl taken from the same mix as the mouldin The tests consist of the application of evenly distributed load on a central ar the width of the slabs and parallel to ends where they are freely supported. T specification indicates the general princi to be followed in the design of cubic Copies of this specification may be obtai from the B.E.S.A. Publications Departme 28, Victoria-street, S.W.1, price 2s. 2d. free.

CHITECTS' & BUILDERS' INQUIRY BUREAU

e glad to give questions and answers, but cannot esponsibility for contributed replies, especially on atters.

ce appeal to our correspondents to submit their on paper of a size easily filed, and written as as possible, or, better still, in typewriting!—ED.

Dampness in Bungalow.

[REPLY TO "PUZZLED," MARCH 18.]

—The signs described by your corre- ent sound more like those of a new house ng its dampness out than anything else. bungalow happens to be the last one built estate to date, this fact would account he conditions being more pronounced in other neighbouring buildings, built apparently identical conditions. Another of a damp internal atmosphere might be ing of ground damp in the house through surface concrete or absence of same. correspondent might satisfy himself upon oint.

another possibility is that of condensa- pon a cold floor surface. In a house in I once lived, I was very much troubled this fault, the ground floors throughout in a cold, hard, non-absorbent com- n, which simply ran with water in spells ggy weather following a cold spell.

s, of course, impossible to say which is ause in this instance, but the above ons may assist your correspondent to the root of the trouble. The cures, or y rate the palliatives, in the above cases r the first, patience; for the second the y of the omission, and for the third, of ventilation.

LUX.

ule of Thumb for Pricing Timber.

[REPLY TO "TYRO," MARCH 11.]

—I notice your correspondent refers to velfth of a foot cube as an inch. The inch is of course one hundred and forty- of an inch, but in quantities it is usual a unit of a twelfth of a foot following ubic foot, and though I have never heard nit given a name, I should like to know, for my own information, whether it is gnised building practice to refer to this s an inch in cubic measure.

TYRO.

Free Alkali in Plaster.

—Can you refer me to any scientific re- which give the time taken for all free to work its way out of a ¾ in. coat of: me plaster; (*b*) Sirapite; (*c*) Keene's or on Portland cement backing; and rtland cement.

DECORATOR.

Apparatus for Rapid Bricklaying.

—A few years ago there was widely tised an apparatus for speeding up aying, even in unskilled hands. Since I have heard nothing further about it. you inform me whether anything has ped in this direction, and, if so, whether eing at all widely used in any districts?

SPEED-UP.

Form of Contract.

—We are small jobbing builders, and are to build a house for a client on his own d. We have submitted an estimate and cation, which have been accepted by nd now we are wishing to draw up an ment or contract between both parties. ou help us in this matter?

P. & P.

So far as we know there is no form of ct in existence which would suit your imme- purpose. A simple letter from you to your undertaking to carry out the work in ance with the plans and specifications, if accepted by your client, constitute a ct. If, however, you want anything han this, your best plan would be to get ch with a solicitor and give him a copy of the 1909 R.I.B.A. form of contract from which he could frame something suitable to your purpose.—ED.]

Ancient Method of Splitting Stone.

[FURTHER REPLY TO "THOMAS," NOVEMBER 26.]

SIR,—It may further interest "Thomas" and your readers generally to know that the ancient method of quarrying stone with the aid of wooden wedges is still carried on along the banks of the upper Yangtse River in the Szechwan province of China. The method is to drill holes in the stone with iron tools, and drive in tightly hardwood wedges. This process is carried out during the low-water season. The wooden wedges are then left in place during the high-water season (a matter of six to seven months), when the action of the water on the hardwood causes the stone to split along the line of the wedges. The blocks of stone are removed during the following low-water season, and the quarrying process repeated, time being of practically no object in this part of the world.

This particular stone (according to geologists) is a very hard limestone of very fine texture. It contains no free lime, has a distinct strata, and is an absolutely reliable building material, making excellent steps and floors that will withstand very hard usage. In appearance it strongly resembles a sandstone, and is of a light grey colour. There is a softer variety of this same stone but of coarser texture, and it is peculiar that the two varieties are very seldom found together.

SPHINX (Hongkong).

THE WEEK IN PARLIAMENT

WESTMINSTER, *Wednesday.*

Small Dwellings Acquisition Act.

Mr. Chamberlain, in reply to Mr. Dennison, said that the following statement showed for each year the amounts of loans sanctioned by his Department to local authorities for the purpose of making advances under the Small Dwellings Acquisition Act and under Section 92 of the Housing Act, 1925, together with figures as to the total number of houses in respect of which advances had been made.

Amounts of loans sanctioned by the Ministry of Health under:—

Year.	Small Dwellings Acquisition Act.	*Section 92 of the Housing Act, 1925.	Total.
1919	£5,533 ..	— ..	£5,533
1920	197,523 ..	— ..	197,523
1921	90,741 ..	— ..	90,741
1922	30,515 ..	— ..	30,515
1923	569,062 ..	£866,761 ..	1,435,823
1924	4,600,427 ..	2,494,179 ..	7,094,606
1925	6,809,770 ..	4,116,442 ..	10,926,212
1926	9,316,091 ..	4,054,051 ..	13,370,142
	21,619,662 ..	11,531,433 ..	33,151,095

In addition, the London County Council, between January 1, 1923, and December 31, 1926, sanctioned or advanced over £2,800,000 under these Acts, and the Birmingham Corporation advanced during the same period under special powers over £1,760,000. The total numbers of houses in respect of which advances had been made under the two Acts up to the end of 1926 were:—

Under the Small Dwellings Acquisition Act	40,636
Under Sec. 92 of the Housing Act, 1925—	
(*a*) Advances	24,577
(*b*) Guarantees to Building Societies	5,937
	71,150

Licensing of Landlords.

Mr. Day asked the Minister of Health whether, in view of the cost to the country caused by sickness owing to bad housing conditions, he would consider the introduction of legislation having as its object the licensing of all property owners who owned and let houses with a rateable value under £80 a year, so as to enforce an approved standard of sanitation and repair in these houses.

Mr. Chamberlain said that local authorities already had wide powers under the Housing Act and Public Health Acts to secure the remedy of defects in, and the necessary repairs to, any houses, including power to execute the works themselves in default of the owners and to recover their expenses from the owners.

Miners' Houses.

Mr. Potts asked the Minister of Health if he would state the number of houses built under the Housing Acts in the 13 mining districts of Great Britain, showing the number of each district; and whether any special provision had been made for the erection of houses in the mining areas in Kent and in the new colliery districts in the vicinity of Doncaster.

Mr. Chamberlain said he regretted that as housing statistics were not classified in mining areas he was unable to give the information in the form desired. The following statement, however, showed for England and Wales the numbers of houses which had been completed since 1919 in connection with subsidy schemes under the Housing Acts up to March 1, 1927, in the areas of local authorities where the mining population in 1921 exceeded 20 per cent. of the total population:—

Counties in which these areas are situated.	Houses completed with State Assistance.
Northumberland	5,327
Durham	12,762
Cumberland	1,288
York, West Riding	25,347
Derby	7,675
Leicester	701
Nottingham	7,755
Warwickshire	2,983
Lancashire	5,498
Staffordshire	6,064
Salop	21
Gloucester	312
Somerset	585
Denbigh	1,263
Flint	38
Brecknock	192
Carmarthen	1,373
Glamorgan	6,194
Monmouth	3,609

In addition to those houses numbers had also been erected by private enterprise without subsidy under the Housing Acts. In reply to the last part of the question he said that considerable areas of land had been acquired for the erection of houses for miners in the Kent coalfield, and those were to be developed on garden city lines by a Public Utility Society. Some 1,200 houses were projected, and construction had already commenced. In the Doncaster area a number of the Colliery companies had made arrangements with the Industrial Housing Association for the erection of houses on some 14 sites. Over 6,500 houses had so far been approved for the grant of loan or subsidy, and some 4,300 subsidy houses had been completed. In addition, authority had been given for the erection of over 12,400 houses in connection with the subsidy schemes administered by local authorities in this area, 9,300 of which had been completed.

Small Dwellings Acquisition Act.

Sir K. Wood informed Mr. Lumley that the numbers of houses in respect of which local authorities made advances under the Small Dwellings Acquisition Acts were 13,603 in 1925 and 18,238 in 1926.

Building Society Advances.

Sir K. Wood informed Mr. Lumley that the numbers of houses in respect of which local authorities undertook to guarantee the repayment of advances by building, &c., societies, under Section 92 (1) (*b*) of the Housing Act, 1925, were 1,559 in 1925 and 3,476 in 1926. Local authorities also made advances under Section 92 (1) (*a*) of the Act in respect of 9,563 houses in 1925 and 10,043 in 1926.

THE BUILDING TRADE

BY-LAWS RELATING TO BUILDINGS AND STREETS.—XIII

STREETS.—IV.

In our last article we showed that one of the recommendations of the Committee on Building By-laws as to the application of by-laws to new streets, where the new street forms a continuation of an existing street, had now been adopted to a certain extent in section 29 of the Public Health Act, 1925, and applied in section 30, whilst as regards width, in certain cases a discretion was given to the local authorities, in approving plans of a new street, to require it to exceed the by-law limit by section 31, and by section 32 where land is being developed at one side of an existing highway thus forming a "new street" that a discretion was also given to the local authority to allow the owner on that side to give up land for only half the required width, an order being served on the owner at the other side of the street that when he commences to develop his land he will be required to complete the widening.

This leaves untouched the first of the two points raised by the Committee, which we alluded to in our last article, viz., that although the model by-laws regulate the width of new streets according to the degree that houses may be set back from the street, there is a doubt whether any agreement so to set back the houses can be enforced against the owners (apart from the Building in Streets Act) and still more so as against their successors in title, and the Committee recommended that power should be conferred upon local authorities to fix building lines by by-law and they also recommended the repeal of the Public Health (Building in Streets) Act, 1888. It is therefore necessary now to consider whether any of the new legislation has touched this recommendation, but it has certainly not been carried out directly by giving a statutory power in by-laws to define building lines, nor has the Building in Streets Act been repealed.

As we understand the Report, the Committee contemplated power being given to local authorities by by-law to fix building lines when a developing owner is laying out a new street on his own property, one of which would mark the boundary of the street whilst the second would define the line of buildings, but by-laws also apply when by building operations an existing street, or part of an existing street, is converted into a technical "new street," for, as we showed in our article on the Public Health Act, 1925 (November 13, 1925), "new streets" are created in both these ways, and the recommendations appear to include such "new streets."

The sections of the Public Health Act, 1925, which we noted in our last article (sections 29 to 32 inclusive), do not touch the question as to a building line except in so far as they apply the by-laws to "new streets" parts of existing highways and give powers as to the width of streets to be laid out, but this means only the application of by-laws under the system at present prevailing, of course, not the amended system recommended by the Committee, and we must now consider other provisions contained in Acts of last year. Section 33 of the Public Health Act, 1925, enables local authorities, where in their opinion any street repairable by the inhabitants at large is narrow or inconvenient, or without any sufficiently regular boundary, or where it is necessary or desirable that that street shall be widened, to prescribe an "improvement line" in relation to either side of the street, or at or within 15 yards from any street corner. This line defines the boundary of the street, that is to say, the line to which it may be widened, and when it has been prescribed, no new building, erection of excavation shall be placed or made nearer the central line of the street than this improvement line, except by consent of the local authority (see subsection (5)). It is clear that this section will not effect any of the objects the Committee aimed at in their recommendation as to building lines. It does not affect a street laid out on private property at the laying-out stage; it does not extend the by-law-making powers of local authorities, but it gives them a discretion as to the width of existing streets in certain circumstances, and this statutory discretion will in certain cases overrule the by-law provisions as to width, but it is confined to the boundaries of the street, that is, the limits to which it may be widened, and therefore does not touch the main point indicated in the recommendations of the Committee as to how the setback of buildings from the street can be assured, a condition upon which the width of the street depends at the laying-out stage under the model clauses. Therefore we think, for the purposes of the subject we are considering, this section may be disregarded.

There remains, however, another statute to be considered—the Roads Improvement Act, 1925. Under section 5 of this Act a county council or other highway authority may prescribe in relation to either side of any part of a highway maintainable by them (subject to the provisions of this section which we noted in an article on this Act in our issue for October 23, 1925) a frontage line for buildings referred to in the section as a "building line," and when such line has been prescribed and has come into force it shall not be lawful, except with the consent of the authority, to erect nearer to the middle of the highway than the building line any new building other than a boundary wall or fence or to make any permanent excavation below the level of the highway nearer to the middle of the highway than that line. It is to be observed this section only applies to highways maintainable by the authority; that is, taken over by them.

In the case of "new streets" which assume that character for by-law purposes when building operations are commenced or proposed in the immediate vicinity of *existing* highways (as distinguished from "new streets" laid out on private land), it appears that this section may forward to a certain extent one of the objects desired by the Committee, the setback of buildings by a line binding on property owners and their successors in title, for where this building line has been prescribed it will probably exceed the by-law width of the street; but it has to be observed that the local authority who make the by-laws is not the same body who can prescribe this building line, and therefore this advantage may be described as fortuitous and not the result of any legislation intended to carry out the recommendations of the Committee.

There is one point in the recommendations of the Committee, that building lines should be fixed by by-laws, which may here be noticed. The Committee took the urban model form as a precedent, as the width of the street is there diminished according to the length of the street and the setback of the houses, but as we have shown, they expressed great doubt whether agreements to set back houses under the by-laws could be legally enforced even against the owner, and still less against his successors as running with the land, and it was for this reason they desired to see the building lines prescribed binding on all parties for all time. This might, however, raise a question as to compensation. The Roads Improvement Act, by section 5, subsection (5), recognises this, as it provides for compensation if the building line injuri affects the property when it is first presc

The Report of the Committee is a ambiguous, but if the Committee tended that the suggested by-law to define a building line should only when a new street is being out on private land, then some *pro quo* is obtained by the owner for s back his houses, as he has to give less for the street under the model clauses; b the light of section 33 of the Public H Act, 1925, it may have to be consi whether this policy does not encourag formation of narrow streets, which in days of rapid development may, after have been taken over by the local auth require widening as "narrow and i venient," in which case, if an "improve line" has to be fixed by the local auth compensation becomes payable to pe whose property is injuriously affected. section 33 subsection (6)).

Thus, assuming at the laying-out stag street was under the by-law provision in width with a setback of the houses, i sequently an "improvement line" con be fixed allowing for a roadway of th width, it is clear that the amenities houses would be seriously interfered with compensation would play a considerable in the street-widening scheme. If, o other hand, the by-laws in the first ins fixed a building line with a setback to the maximum width of roadway, the object of the Committee would be defe for they approved the principle adopte the model clause but deprecated the taki unnecessary land at that time, as the f ing passage from paragraph 70 of the R shows: "The surrender of land for the f tion of a street (under by-laws with r to width) and the expenditure of mon construction (under by-laws with respe the construction, or in pursuance of cond for the taking over of the street) is a b on the developing owner or the builder consequently a tax upon the future tena the buildings, and we do not think it that penal legislation (which by-laws of are) should make this burden heavier will secure, firstly reasonable access t land developed and the buildings on it secondly, that land developed shall n reason of narrow and inconvenient stre a barrier to the normal traffic of the dis Clearly, if at the laying-out stage a bu line were to be fixed which would efficient for all time, it must offend a the above passage, and compensation have to be given to owners who were sacr land, not to afford reasonable access t land, and to bear the traffic normal a time, but with a view to future public r ments.

The Committee passed two criticisms Public Health (Building in Streets) Act firstly that there was considerable doubt the application of this Act where bu were separated by intervening vacant and secondly that it contained a power to the local authority to exempt person its operation. There is great force latter criticism if the Act was inten provide a building line, and the Repo the point thus: "We do not think th vesting of the power of excusal in th authority is altogether satisfactory, sin effect, if not one purpose, of the Ac protect the existing property of an owr voluntarily sets back his building furth he need do, and it might be arg acquires rights which ought not to b away from him without his own co The first of the above criticisms, h applies with more force where an highway is converted into a "new stre building operations than it does to velopment of a building estate where th are necessarily of short length and whe must be some degree of proximity a

ity between the houses to be erected on estate.

Ve set out the cases on this question in a on the recent case, Attorney-General *v.* rd (1925, Ch. 318), in our issue for ust 21, 1925, and we need here only quote assage from the judgment of the Master the Rolls: "If you find the house relied n is so far distant that no person in nary parlance would say it was the next se in the same street, you cannot hold that section has been transgressed. There st be some reasonable measure of con- ity and proximity in order to find that re is a house on either side to which the se in question must conform." In that the building was being erected at the side main road, and there was a distance of ft. between it and the house with which as contended it must conform as to set- k, and the Court of Appeal held that the did not apply to that case.

Ve have made the above observations upon Act because it appears to us that if it e amended, first by taking out of it the er to excuse a person from its operation, secondly by altering the terms in which necessary contiguity to an existing house ady set back are expressed, and, thirdly, king it apply in rural districts without the essity of adoption, it would, in conjunction h the by-laws, attain what the Committee in view, the fixing of a building line ding upon all parties.

The words of section 3 of the Building in eets Act are, at present: "It shall not be ful without the consent of the urban hority to erect or bring forward any house building in any street or part of such house building beyond the front main wall of the ise or building on either side thereof in same street."

Ve must continue our observations on this nt in our next article.

NEW BUILDINGS IN LONDON

Barnes.—Hall.—The London County Council ommend that, subject to the consent of the nister of Health, a site on Castelnau estate. rnes, be sold to the Church of England horities for £750, for the erection of a church l.

Becontree.—Church.—On a site in Becontree- nue the Essex Baptist Association are to t a church. The site is about to be pur- sed from the London County Council.

Becontree.—Shops.—Mr. W. White is to erect shops with living accommodation on a site be purchased from the London County ncil in Becontree-avenue.

erners-street. — Hostel. — An anonymous or has given £160,000 to the Middlesex pital towards providing a complete hostel training school for nurses. Mr. Young, of rs. Young & Hall, architects, Southampton- et, Bloomsbury, has designed the plans.

roydon.—Shops.—Plans have been prepared Messrs. North, Robin & Wilsdon, architects, Maddox-street, W. 1, for the erection of nty-four shops with flats over at Dovercourt- de, London-road, Croydon.

ownham.—Houses.—The London County ncil are proposing to spend £810,000 for the ion of 1,266 more houses and flats on the lant-lane site of the Downham estate, isham. The contract is probably to be n to Messrs. Holland & Hannen and Cubitts, , of 258, Gray's Inn-road, W.C.1.

tham.—Enlargement.—An enlargement is e made to the sub-station depot on Eltham n, for the Woolwich Borough Council.

ammersmith.—Shops.—The London County ncil recommend that, subject to the consent e Minister of Health, the two plots of land Vormholt estate, Hammersmith, be let to R. J. Jones, for the erection of about 22 premises with dwelling accommodation

wisham. — School. — The Lewisham ugh Council has decided, subject to approval of the Ministry of Health, to sell to the London County Council a site of 1½ acres at the Grove Park housing site for the purpose of an elementary school.

Limehouse. — Houses. — Messrs. Culpin & Bowers, architects, have submitted plans which have been approved by the Stepney Borough Council for the erection of houses on the north side of Commercial-road East, abutting on east side of Brunton-place.

Little Argyll-street.— Rebuilding. — Messrs. F. W. Field & Sons, Ltd., 1, Little Argyll-street, Regent-street, W., have announced that their warehouse is shortly to be pulled down and rebuilt.

Marylebone-road. — Additions. — Messrs. Bovis, Ltd., of 43, Upper Berkeley-street, W.1, are carrying out new additions to the Marylebone-road Grammar School. The plans for this work have been prepared by the architects Department of the London County Council, for whom the work is being carried out.

Merton.—Houses. — The Urban District Council are erecting houses on the following sites: 38 on the Cannon Hill-lane and 62 on the Whatley-avenue site of the Whatley housing estate, Merton. Mr. G. Jerram is the engineer and surveyor.

Northumberland-street.—Additions.—Messrs. Constantine & Vernon, F. and A.R.I.B.A., architects, of 82, Mortimer-street, W.1, have just prepared plans for the erection of a new building at the laundry at the St. Marylebone Home, Northumberland-street, W.1, for the St. Marylebone Board of Guardians. Tenders are now being invited.

Purley.—Fire Station.—The Coulsdon and Purley U.D.C. have authorised the Clerk to invite tenders for the erection of the fire station premises, in accordance with the plans prepared by Messrs. W. B. Nicholls & B. Hughes, architects.

Riddlesdown.—Building.—Further developments are being carried out on the Mitchley Wood estate, Riddlesdown, situated on the borders of Croydon, Sanderstead, and Purley, comprising about 400 acres. The road-making contract has been completed and building operations are already in hand. The surveyors are Messrs. Blake, Son & Williams, 49, Chancery-lane, W.C. 2.

Rye-lane.—Store.—The Co-operative Wholesale Society, Ltd., of 99, Leman-street, E. 1, are about to erect on a new site in Rye-lane, S.E., a new branch stores. The plans for the scheme have been prepared by the Architect's Department of the Royal Arsenal Co-operative Society, Ltd., and the building work is to be carried out by the Co-operative Wholesale Society Building Department.

St. Mary-axe, E.C. — Reconstruction. — Premises with frontages to Bury-street, St. James's-court and Heneage-lane, E.C., are being reconstructed and converted into offices. Messrs. Percy C. Boddy & John Dempster, F. & A.R.I.B.A., of 19, Palace-street, Westminster, S.W. 1, are the architects. Messrs. F. Green & Sons are the builders; whilst Messrs. Young & Co., of 6, Queen Anne's-gate, S.W. 1, are responsible for the constructional steelwork.

Vauxhall Bridge-road.—Premises.—A public-house, named "The Duchess of Clarence," is to be erected in Vauxhall Bridge-road, for Messrs. The Cannon Brewery Co. Messrs. Douglass Halse & Co., Ltd., Green's End, Woolwich, are the building contractors, and Messrs. Young & Co., of 6, Queen Anne's Gate, Westminster, S.W.1, are supplying the constructional steelwork.

Whitechapel.—Houses.—The Stepney Borough Council has approved the recommendations made by the Ministry of Health in connection with the 89 tenements to be erected by them upon the site in Vallance-road, Whitechapel.

Woolwich. — Sub-station. — A new sub-station is to be constructed by the Woolwich Borough Council on a site in Shawbrooke-road, Eltham estate.

RELATIONS BETWEEN ARCHITECTS AND BUILDERS

There was a large attendance at the meeting of the Northern Architectural Association, held at 6, Higham-place, Newcastle, on March 23, when Alderman Stephen Easten, O.B.E., J.P., of Newcastle, gave a talk on "The Relations between Architects and Builders." Lieut.-Colonel G. Reavel, O.B.E., F.R.I.B.A., President of the Association, occupied the chair. An invitation had been extended to representatives of the National Federation of Builders, and as a result there was a good muster of local builders. Such a gathering is unique in the history of the Association, and it was agreed generally that a development of the idea of joint meetings was likely to prove of benefit to the building industry as a whole by cultivating closer friendship and harmony between the building trade and the architectural profession.

Mr. Easten dealt almost exclusively with the difficulties which have arisen in the past in formulating contracts. He prefaced his remarks with a brief reference to the 1909 contract, the 1920 contract (which, he said, was never used), and more recent efforts on the part of the interested parties, together with representatives of the Government, to draw up a new contract. These had broken down. In his opinion the difficulties in the way of preparing an equitable contract were more imaginary than real. At the outset he stated emphatically that he would never ask the architects to approve of a contract which he would not himself approve if he was an architect himself. What was wanted was fair play all round. He had friends who asserted that architects were just where they were 30 years ago, and that they were conservative, out of date, and had not made the necessary forward movement which other trades had made. This was unfair. They had gone a good part of the way, and if the builders wanted them to go a little further they must be prepared to show that there were real reasons for asking them to go that little bit further. The 1909 contract was certainly better than anything else existing to-day. The contemplated new contract had, as he had said, broken down, and he wanted to appeal to all architects present to see if the several points at issue were not worthy of careful consideration. The whole question was one of the architect's sole discretion on certain matters.

Dealing with Clause 2, with reference to the obligation on the part of the builder to give notice in writing to the architect of extra payment being necessary where amendments are made to a contract, Mr. Easten thought that the builder's case was one with which every decent architect would agree. When a building owner desired to have a building he called upon the service of an architect, a quantity surveyor, and a builder. Each should take his share of the work, and there should be no payment without satisfaction. It was entirely wrong, in the opinion of the builders, that the builder should be compelled to keep the necessary check to comply with the clause. The average builder knew little or nothing of quantities, and he ventured to assert that 90 per cent. of the builders could not do it, if they were willing to do it. He submitted that it was impossible for the average builder to satisfy himself whether amendments of a contract were extra upon the work for which he had tendered.

Dealing next with Clause 4, which states that "the contractor shall provide everything necessary for the proper execution of the work . . . whether the same may or may not be shown in the drawing or described in the specification," the speaker submitted that it was the duty of the architect to see that the specification was correct. The speaker also took exception to Clause 16, which empowers the architect to demand the removal, in a reasonable time, of any material which in his opinion is not in accordance with the terms of the contract. It was this clause, he said, to which builders took the greatest objection. They agreed without hesitation that the architect should have power to condemn any work he did not want, whether it was right or wrong, but equally emphatically they considered that builders should have the right of appeal to an arbitrator as to whether the action of an architect in this connection was reasonable or otherwise. He could quote more than one instance where removal instructions had proved absolutely disastrous to the builder. They were all aware of brilliant young architects who had secured big contracts without having had any appreciable amount of practical experience. In such cases they occasionally relied upon their clerk of works, and there were times when clerks of works were not so discreet as they might be. He cited cases in which clerks of works had condemned some of the best material he had ever seen in his life, simply because it did not comply literally with the conditions of the contract. In a particularly outstanding local case thousands of pounds of extra expense were entailed simply on a point of this kind, with the result that the contractor, or rather his creditors, had to meet the extra charge. How many of them, he asked, wanted such conditions? His respectful submission was that architects wanted to be fair and honest, but that they did not want to take advantage of clauses which, as they stood, permitted unscrupulous people to take advantages which were neither in the best interests of the architects or builders as a whole. They as builders did not want a contract which was not fair to the architects; they asked the architects to say that they did not want one which they would object to if they were contractors. Mutual advantage and benefit were the things which should be aimed at.

The President read a letter from the Architects' and Builders' Joint Conciliation Board, welcoming the Newcastle joint meeting, and stating that such co-operation was likely to encourage the spirit of mutual help and friendship which the Board was anxious to promote.

Moving a vote of thanks to Mr. Easten, Mr. T. R. Milburn said they all appreciated Mr. Easten's views whether they agreed with them or not. He quite agreed that the old agreements were harsh, and that too much power was given to architects in the settlement of disputes. As far as he was concerned, his "bible" was that the architect should leave the settlement of all claims for extras with the quantity surveyor to be mutually agreed between the contractor and the architect, and that the surveyor need not necessarily be the man who had taken out the quantities. He appreciated the presence of so many builders. Such a meeting was a great advantage to both sides, because it brought them together in a friendly spirit. Speaking as one who had had no serious quarrel with a builder for thirty years, he was pleased to say he did not see why there should be any. Contracts could be a good deal too hard and fast and a great deal of latitude should be left as between man and man. The builder, he thought, should take the measure of his man, and judge his character. He was obliged to take exception to the objection of the builders to the clause with reference to checking details. To cite a case, surely it was a simple matter when a detail came along stipulating for, say, twelve panes of glass to a window instead of six, for the builder to point out the extra work entailed and for the architect to put the matter right. Dealing with the removal of materials and condemned work, the speaker said he thought that some reliance must be placed upon the fairness of the architect. What was wanted was a spirit of co-operation rather than adherence to any hard and fast agreement.

Mr. J. Bertram, seconding the vote thanks, said they owed a debt of gratitude Mr. Easten for the mutual good feel existing at the present time between ar tects, builders, and operatives. A good d of the unpleasantness and trouble experien at present was imaginary. If both si played the game in a sporting way there n be nothing to fear.

Responding, Mr. Easten said the purp of his talk was to endeavour to do good the trade as a whole. His object in dwell upon certain clauses which he had discus was to point out that they presented temp tions to the unscrupulous in a way which decent architect would tolerate.

The Chairman said that in the North th had been much good feeling, which had s plified proceedings. There was a great d in the claim that agreements should be fran so as to give fair play all round. Giving word of advice to young architects, he s that although they might have to rely on discretion and knowledge of the clerk of wo it was necessary at times to exercise a bala between their claims and those of the ot side.

The vote of thanks was accorded w acclamation.

L.C.C. SCHOOL OF BUILDING:

Presentation of Prizes.

The Minister of Labour, Sir Arthur St Maitland, Bart., M.P., presented the prizes successful students at the London Cou Council School of Building, Ferndale-ro Brixton, on Friday last, the Chairman of Advisory Sub-Committee of the School, Mr. H. Searles-Wood, F.R.I.B.A., being in the chair

The Chairman introduced Sir Arthur St Maitland, who, opening his address, said that looked upon the L.C.C. School of Building as of the finest instances of the marriage of edu tion and industry. The work that was go forward was an actual attempt at solving th kinds of questions that thinking people w looking into to-day, the means by which a h level of attainment might be reached. problem was one of how to join together act technical instruction and practical experie A man had a better chance of getting on if, a practical experience, he got technical instruct also. The school was to be congratulated on successes gained and on the progress it had m since it began 20 years ago. He hoped believed that that success, both in mat things and in those things that were beyond material, would continue.

He then presented the prizes and certific to the successful candidates.

Mr. Everett, the Acting Principal, then re report on the year's work and said how m they all missed the Principal, Mr. Sage. Ha been there he would have been able to say the note of optimism struck at last year's p giving had more than been maintained. evening students had increased, as had also "course" students, while the day classes also grown in number. The boys in the sc promised worthily to uphold its traditions. was glad to say that a new playing field had acquired at Raynes Park, which would l great assistance in developing the corporate of the school's life. In the R.S.A. Industries Design Competition members of the school carried off no fewer than four prizes, while commendations had also been gained. al o had had Mr. E. Berry Webber, who been selected as one of the last six in the chester Town Hall Competition.

The speaker wished to convey from Principal the latter's grateful thanks fo colleagues' loyal co-operation and support

Mr. Arthur Pierrepoint then proposed a of thanks to Sir Arthur Steel-Maitland, and was seconded by Mr. George Hicks and supp by Capt. O. Wakeman, M.A.

Sir Arthur replied briefly and a very co vote of thanks to Mr. Searles-Wood, the man, closed the meeting.

THE INSTITUTE OF BUILDERS

r annual dinner of the Institute of Builders held on Tuesday, March 29, at the Carpen- Hall, Throgmorton-avenue, E.C.

. Alfred J. Forsdike, the President, occupied hair, and among those present were Lord ace Percy, M.P. (President of the Board of ation), Mr. Sheriff Percy Vincent (repre- ng the Lord Mayor of London), Mr. C. t Robertson, C.V.O., LL.D. (Principal, The ersity of Birmingham), Mr. David Flather Master Cutler of Sheffield), Sir Frederick M.P. (Past-President), Mr. W. E. Collier, A. H. Adamson, and Mr. E. W. King (Presi- National Federation of Building Trades, loyers of Great Britain and Ireland),Mr. Savory, Major A. D. S. Rice, Messrs. A. cis, G. W. Forsdike, S. W. Milburn, F. G. es, J. Faulder Burn, H. Bell, H. T. oway, Roland B. Chessum (Senior Vice- ident; President of the International ration of Buildings and Public Works), owlem Burt (Vice-President), S. Guy Sap- (Vice-President), Ernest J. Brown (Past ident), P. W. Fremantle, F.S.I., Major Ralph olliday, M.C. (Past President), Messrs. J. W. ley Burmester, F.R.I.B.A., A. W. Forsdike, ley C. Else, W. F. Wallis (Past President), Prescott Ivens, W. D. Forsdike, W. B. ering, Sir J. Walker Smith, Mr. H. Williams, ncillor Reeves Charlesworth, Mr. B. C. us, Capt. G. J. Aldous, Messrs. R. Angell, Barns, A. S. Bennion, T. W. Boddy, Darcy dell, E. J. Brown, G. M. Burt, B. H. sum, R. A. Costain, W. P. Costain, Croad, H. Dicksee, W. W. Dove, B. Falkner, P. Gleed, Major B. P. nwood, Messrs. W. H. Greer, Stanley p, H. H. Holliday, E. C Holloway, H. T. oway, W. Kaula; H. J. Leaning, F. W. by, I. MacAlister, F. M. May, S. W. Milburn, anklyn Murrell, W. T. Plume, H. Westbury ton (Master of the Worshipful Company of enters), S. G. Sapcote, E. J. Savory, Sir J. ker Smith, Messrs. S. Tatchell, A. G. earne, Major F. A. Wallis, Messrs. F. E. is, J. A. Wallis, and P. J. Spencer, B.A. retary).

ter the loyal toasts had been honoured, the ident proposed "the Right Hon. the Lord or, the Sheriffs, and the Corporation of the of London," and Mr. Sheriff Vincent onded.

. A. H. Adamson, submitting the toast of e Houses of Parliament," warmly included ehalf of the Institute of Builders Lord ace Percy and the other representatives of House of Commons. He said that the try was anxiously awaiting the Cabinet's osals for trades union reform. Some of might feel that the Cabinet had taken a long in preparing those proposals, but it should membered that many of the difficulties with industries were faced were due to hasty ill-considered legislation. There were two matters engaging the attention of His sty's Government which were of particular est to the building industry. He referred e housing subsidy and rent control. They o remember that the building industry was the dole" and they all looked forward to ime when they would be free of both the ng subsidy and rent control. Special ation was no doubt necessary to overcome hortage of houses due in the first place to inance Act, 1910, and in the second place to ar, but they did not want to go on with this ial prosperity of the building industry; desired to get back to free conditions. A ective Parliamentary measure of interest to uilding industry was the Architects' Regis- n Bill. There was apparently great ity of opinion among architects and ers on the possible effects of the passing of measure. Some architects had expressed definite opposition to the Bill and some ers thought that it could do no harm. s had expressed the opinion that it would widely separate the artistic from the con- ional side of building and tend, in a way, stroy some of that co-operation necessary en architects and builders if we were to have fine buildings. The question of education was one that had been receiving the earnest consideration of the Institute of Builders, which realised that the future efficiency and prosperity of the industry depended on the education and the technical training of the men who were to become the master builders of the future. He did not think it likely that the Institute of Builders would ever wish to put forward a Bill for the registration of builders, but they hoped that their proposals for the education of the rising generation would receive that loyal support from the Board of Education which had been extended to the other great industries of the country.

Lord Eustace Percy, responding to the toast, said in regard to the proposed trades union legislation they had to be careful in any such legislation to confine themselves to things which would commend themselves to the good judgment and the common sense of the average Englishman and Englishwoman. If they were looking in connection with trades union legislation to greater peace in industry—greater settlement and content—they must look for it not so much through any compulsive or repressive legislation as through a development of industrial education such as that to which Mr. Adamson had already referred. The great problem of the future was to give to the industrial workers that social status which proceeded from pride in his own work and the feeling that his own work was a work which had educational standards behind it for which he was to fit himself by qualifying according to certain standards laid down by the industry. Now, hitherto our technical education, unlike the education of some other countries, had been too much an education given in response to the ambition of the individual worker, not so much to qualify himself for the job on which he was engaged, but to lift himself above and beyond the present job. There was comparatively little technical education in this country in the form of part-time day classes. In such a problem the President of the Board of Education, as representing the House of Commons or even the local education authority, could do very little except in response to a most definite demand from the industry itself, a demand crystallised into educational proposals which the industry was prepared to take up. Their industry had made some progress in that direction in London, in Liverpool, in Manchester and in other parts of the country, and he only wanted to say, in response to the invitation given him by Mr. Adamson, that they might rely upon him for the fullest and most eager co-operation to help them in any proposals which they might put forward.

Mr. C. Grant Robinson, proposing the toast of "The Institute of Builders," said that the Institute could not claim such a long, complicated and picturesque history as the Corporation of London, but, like other great organisations connected with powerful industries, it could truly claim most important functions and high ideals. Like other great organisations of a professional or industrial kind, it was founded, above all, to maintain a high standard of professional integrity and efficiency in the building industry. That it had done so and by doing so it had rendered a public service not merely to the industry and profession that it represented, but to the whole of the public was, he thought, beyond dispute to anyone who had taken the trouble to study its achievements and its history. But it aimed at more than that. It aimed at what Lord Eustace Percy had just been emphasising; it aimed at endeavouring to maintain a high standard of qualification of those who would enter and carry on that great industry. It had been adding, in the later chapters of its history, another function—that of the educational side, and linking that up (he hoped it would link it up still more and do more to promote it) with research, particularly in all those matters which so vitally affected the value and the prosperity of the industry. Therefore, in commending that toast to the company, one was really commending the highest principles that the industry could have before it and asking those who were engaged in that industry to give it their full measure of support, and to remember that it was only by maintaining all those functions and not merely one of them that the purposes of the Institute of Builders could be fully and most fruitfully achieved. The building industry was one of the most important industries in this country. It was an industry the efficiency and prosperity of which vitally affected every class in the community as well as every great public interest. They had only to mention the sinister words "the housing problem" to bring before them one of the most complicated, one of the most difficult, and at the same time one of the most fundamental aspects of the social and economic problems of our time. Standing outside politics, he had always believed that many of those problems which were called social or economic or political or industrial would be very largely solved if they could solve satisfactorily the housing problem. Therefore, if he could make very briefly the confession of an individual creed, he was very glad indeed to hear Mr. Adamson, who, he presumed, was speaking the minds of his fellow-members, say that he hoped we were within measurable sight of seeing a large amount of that State share or interference or control diminishing until finally it disappeared altogether. There might be times when it was necessary to put manacles or handcuffs on an industry in a period of national crisis, but he was profoundly convinced that no industry could continue to be prosperous or efficient if it were to be perpetually manacled or handcuffed.

He believed that anything that stopped the individual springs of action, of effort, of initiative or of aspiration, was not really either in the interests of the individual or of the nation as a whole. Those great professions which gave the largest scope to individual action and initiative were controlled by an organisation from the industry itself which had pitched its ideals high and was endeavouring to maintain scientific efficiency throughout. That seemed to be exactly the position of the Institute of Builders. It supplied from the best brains of the industry itself just that organisation which could prevent indivdualism uncontrolled from doing harm, but it would, at the same time, give latitude consistent with the high standards maintained by the Institute to every variety of human brain and human industry.

The President, in reply, said that the Institute was founded in 1834, but not quite under the same conditions as those under which it now existed, although they had just issued the forty-third report. The organisation had not always been quite so active as it was now. That was the largest gathering they had ever had at the annual dinners. During the past few years the Institute had expanded very considerably and its activities had extended into the Provinces. In the last few years its membership had trebled. Work of the most valuable kind was being carried out by the various branches in Liverpool, Manchester, Birmingham, and Cardiff. The formation of other branches was now in prospect. They all realised the importance of the building industry, and at the same time they felt that if it was to maintain its rightful position in the country, work must be carried on among the young men who were now entering it and upon whom would devolve the responsibiilty of the future. They were extending their usefulness to New Zealand and Australia, where already there were quite a goodly number of members. It was hoped to form branches in those Dominions. During the last few years they had instituted examinations for licentiate and associate members, and the difficulty of getting men to prepare themselves and to obtain the tuition for the examinations was passing away. In years gone by the building industry had been neglected from an educational point of view. There were evening classes now in every industrial centre and we were better equipped with technical schools.

Mr. W. E. Collier proposed the health of "Our Guests," to which the Master Cutler of Sheffield replied.

MANCHESTER BUILDING TRADES' EXHIBITION

On Tuesday this week, Sir Edwin L. Stockton opened a representative exhibition of building materials at the City Hall, Manchester. The chairman at the opening ceremony was Mr. Harry S. Fairhurst, F.R.I.B.A., who, in introducing Sir Edwin Stockton, said he expressed the opinion of those present when he referred to the Exhibition as a magnificent display of all that was best in building materials and equipment. He particularly referred to the question of domestic labour-saving, and mentioned the enormous amount of work the housewives of Manchester would be saved if each were only saved five minutes a day: expressed in housewife-hours the figure reached millions.

In declaring the show open, Sir Edwin Stockton congratulated the organisers on having brought such a representative collection under one roof. In view of the housing shortage, he said, there was no more important industry to-day than that of building. The character of the nation was formed in the atmosphere of the home, and everything should be done to make the homes as attractive and comfortable as possible.

THE STANDS.

On the stands is to be seen a representative collection of builders' plant and building materials, which is notable for the excellent quality displayed throughout the Exhibition. Nothing is to be seen that has not been thoroughly tried out, or is not obviously capable of all that is claimed for it. We miss the unusual and the "gadgets"—and perhaps it is as well.

"The Builder," Ltd. (4, Catherine-street, London, W.C. 2).—Stand No. 45.—In addition to copies of *The Builder* and the monthly *Architecture*, on this stand is to be seen a collection of books of interest to architects, builders, surveyors, and all interested in building. Books on the topical subject of small houses and the vital question of estimating are to be seen, together with authoritative books on practically every subject connected with building. All who desire to keep up to date with new ideas in planning and building should make a point of inspecting the works displayed on this stand.

Acme Patent Ladder Co. (Earlsfield, London, S.W.1).—Stand No. 28.—The builders' and decorators' plant made by this firm is almost too well known to call for detailed description, and here it is displayed to good advantage. Patent telescopic ladders of the extension type, with both round and oval rungs, are shown side by side with all types of steps, trestles, and carts. Some of these, particularly the "Guildhall" scaffold trestles, possesses exceptional possibilities of labour-saving and lowering scaffolding costs.

D. Anderson & Son, Ltd. (Stretford, Manchester).—Stand No. 53.—On this stand one specially notices a mineral-surfaced roofing felt, which is shown in different colours, which give entirely new impressions of the capabilities of a type of roof covering that has claimed efficiency before artistic appearance; here we see that it can be efficient and attractive. The methods of using the firm's well-known brands of roofing felts are shown by practical demonstration on sections of a Belfast roof, from which the method of finishing at verges and parapet walls may be seen at a glance. The application of "Rok" roofing is also shown in connection with a flat concrete roof. Various types of damp-courses, shingles, etc., are shown, and also "Sidol" wood preservative and "Bondex" plastic compound.

British Fibrocement Works, Ltd. (Erith, Kent).—Stand No. 38.—In demonstrating their selections in cement products this firm is making a special display of antique brown slates; this is the type to which we have become accustomed on many housing schemes of local authorities; they are in good colour and have been proved over a period of many years to weather well. Other uses of asbestos-cement products are shown throughout the stand, including flat and corrugated sheets for roofing and walling; flat sheets for ceilings, etc. This stand gives an excellent idea of the possibilities of the material for decoration; it is shown in a variety of surfaces and in different colours—grey, blue, red, and brown—panelled out to show what can be accomplished when harmonious colours are selected for interior decoration schemes.

Concrete Unit Co., Ltd. (Trafford Park, Manchester).—Stand No. 34.—This firm is well known for its concrete products, such as fence posts, sills, heads, blocks, slabs, etc., many thousands of which are in use. A new feature, shown here for the first time, is the "Stonehenge" system of building partition walls. This consists of concrete slabs, 2¾ in. thick, so shaped that they interlock throughout the horizontal joints, that is, each course is locked to the course below by a joint about 6 in. in depth to ensure absolute rigidity. Each unit, or slab, covers about one-third of a yard super. These are not mortared, so that it is a simple matter to remove the partition at any time. The resulting wall is smooth on both sides, and as the units are thoroughly cured before delivery they may be papered or painted immediately they are built without the possibility of the covering being ruined by damp. No plastering is necessary, as the concrete is smooth.

John Dickinson & Co. (Bolton), Ltd. (Fairclough-street, Bolton.)—Stand No. 24.—On this stand is displayed a range of asphaltic and bituminous materials manufactured by the Company for flooring and roofing. These include "Aciteno" acid-resisting asphalt, "Seal" brand asphalt for roofing, tank lining, etc., and an asphalt specially made for abnormal conditions such as tropical heat. Prominence is given to a road asphalt, which the firm manufactures and lays. Another section of the stand is devoted to building stones and paving flags; the latter are natural stone, including sawn, machined, tooled, polished and self-faced.

Drew, Clark & Co. (Leyton, London, E.10).—Stand No. 15.—"Rap-Rig" patent scaffolding, which, as its name applies, is specially designed for rapid erection, is the most prominent feature of the stand, which also displays the wide range of ladders, trestles, steps, and similar plant for which the firm is well known. The popularity of "Rap-Rig" scaffolding is conclusively proved by the photographs and testimonials exhibited. This scaffolding is sectional, supplied in units of 7 ft. 6 in., with a platform 11 ft. by 11 ft., and is made so that it can readily be built to any height with a minimum of labour. It is claimed that "Rap-Rig" scaffolding reduces scaffolding costs by 50 per cent. Decorators will be interested in the telescopic ladders (Drew's patent) with automatic locks without springs or other working parts liable to get out of order with consequent danger to users.

A. Dreyfus, Ltd. (Belper-street, Loftingroad, London, N.1).—Stand No. 8.—A method of restoring stone which has been in use since 1884 is here demonstrated by specimens of stone before and after reconstruction. While the process is applicable to all building stones, Mansfield and Bath stones are principally shown. It is claimed that sulphurous and smoke-laden atmospheres have no effect on stone restored by this process, and as proof of this statement a photograph is shown of the Guild Chapel at Stratford-on-Avon which was restored in 1902, and which is still in excellent condition. The restoration process takes the form of crushing the stone and remaking it with acid, no cement being used.

Eclipse Rail Track Ladder Co. (60, Upper Maudlin-street, Bristol).—Stand No. 10.—Another selection of builders' and decorators' plant is here shown, including all types of ladders, steps, trestles, etc. A special fea is made of extension scaffold boards, fol tables for paperhangers, and other collap and folding plant designed to minimise s age space and facilitate transport from one to another. Many new features are to seen, which, although small in themsel are useful in obtaining maximum efficienc connection with this type of plant.

Educational Supply Association, (Esavian House, High Holborn, W.C.1. Stand No. 57.—Doors, partitions, scre and windows in different designs are sho all having the special feature that they eit fold or slide to economise space. Much genuity is displayed in the design of th fittings and partitions, by which any sh opening, flat or curved, may be fitted w sliding or folding doors or windows fitt neatly at the sides. All the sliding do and partitions are equipped with ball be ings of generous dimensions to ensure e running. We are informed that these fitti are specially favoured for use in schools sanatoria.

Elsan Manufacturing Co. (34-35, High H born, W.C.1).—Stand No. 89.—For coun houses or cottages where public sewers not laid the Elsan chemical indoor closet p sesses many advantages over the older often primitive systems. All sewage enter this closet is sterilised and converted int harmless liquid so that when emptied into adjacent pit it percolates into the soil with leaving any smell. This type of closet d not need a water flush, and is so desig that it cannot clog or give rise to offens odours; it has been used by the Lond County Council, Manchester Corporation, other large local authorities.

Etchells, Congdon & Muir, Ltd. (M street, Ancoats, Manchester).—Stand No. —A feature of this stand is an excelle example of a well-designed lift car, made grey sycamore with walnut inlay. The fi grain of the wood, the good design, and e cellent workmanship combine to make a car that is an example of how attracti such a utilitarian feature of modern buildin can be when thought is given to eve detail. That the standard of design a construction of the cars is maintained the gear and controls is shown by exhib of various types of indicators, signs, contro gears, etc., as fitted to the firm's produc including the ingenious sliding door mo ment. The lift is here shown in worki order, so that its smooth running may tested by those interested.

Fernden Fencing Co., Ltd. (Bridge-stre Guildford, Surrey).—Stand Nos. 3 & 4.— green hard tennis court has been added the products of this firm, and a model sho ing the colour, the firmness of the surfa and the porosity of the material to enable to be fit for play immediately after heavy r is shown on the stand. The fencing, gat paling, etc., for which the firm is w known, are exhibited in a wide range of signs, some well-designed oak and chest gates being particularly noticeable.

John Fowler & Co. (Leeds), Ltd. (Leed —Stand No. 26.—"Fowler" mixers notable for the great strength of the dru the part subject to the most wear and t due to the continual battering against it the contents, weighing 5 or 6 cwt. They of the revolving drum type, and made various sizes. On the stand are shown t sizes, with batch capacities of 5 4½ cu. ft. of mixed materials respective Features of these machines are pow operated loading skips, and on the lar machine a hoist mounted on the same fra a 5 h.p. paraffin engine is also mounted the same frame, and is capable of runn the mixer and hoist simultaneously. T type of combined mixer and hoist has c siderable possibilities of avoiding dou handling on building works where concr has to be elevated. There are also on viev 10 cwt. independent hoist and a 15 c hoist, with lifting speeds of 65 ft. a minu

. Keizer & Co., Ltd. (66-72, St. Anne-et. Liverpool).—STAND No. 47.—Devoted demonstrating the uses of plywood, this is of the most interesting stands at the w and shows what can be done in the d of decoration with this comparatively material. Different woods are made up panelling for walls, ceilings, friezes, etc.: e have been selected for their fine grain, beauty of which is enhanced by the high ree of polish given to them. A special ibit demonstrates the non-warping and -shrinking properties of the material, ch is one of its chief attributes. Ply-od is also shown as parquet flooring, for ich purpose it is claimed to be cheaper n the usual parquetry, while at the same e equally effective patterns may be ained.

Langley London, Ltd. (161, Borough High-et, S.E.1).—STAND No. 49.—To display ir tiles to the best advantage, Messrs. ngley London, Ltd., have availed them-es of the services of Messrs. Halliday & ate, the Manchester architects. The pro-ts of the Courtrai-du-Nord Tile Co., Ltd., shown on the same stand. A feature is de of a green interlocking pantile with a zed surface, which looks very well on the efully proportioned roof. Hip tiles of the ne pattern are also shown in position on structure. More well-known tiles, mar-ed by the companies, such as the Mar-les. Beauvais, and Courtrai-du-Nord are wn in various patterns so that the texture l colours may be seen. The simplicity h which these tiles may be fixed or cut necessary is shown by models. The Gillar-i tiles, which, we are informed, are in-asing in popularity in this country, are o exhibited, while the extent to which these oducts have been used all over Great tain is demonstrated by many photographs l lists of contracts.

Liner Concrete Machinery Co. (Glasshouse idge, City-road, Newcastle-on-Tyne).—ANDS Nos. 5 & 6.—Builders as well as con-te specialists will find much to interest m here, from small and inexpensive chines for the production of concrete slabs, cks, and bricks, to large moulding presses making concrete units up to 10 ft. in gth. All these machines are hand-erated; in the case of those which turn the ducts on their side to discharge, counter-ights are used to minimise the effort essary. The small block and slab chines are fitted with iron mould boxes, n which the blocks are extruded by a er operated by hand or foot. The larger sses make sills, steps, lintels, etc., of any pe according to the wood blocking piece, l to avoid any damage to the arrises the uld box is turned on its side to discharge. connection with the larger machines a rail-ck with a lifting platform mounted on a ck is provided, so that the casting may be oved from the press to the curing area hout the need of man-handling. A new e of mixer is also shown, consisting an open horizontal circular drum in which olve heavy wheels and spades; the machine pecially designed for mixing semi-wet con-te. Discharge is through a sliding door at bottom of the drum. Another new item be seen here is a flag-moulding press, in ich 24 flags are made at a time on edge.

Merchant Trading Co., Ltd. (34, Bishops-e, E.C.2).—STAND No. 55.—"Celotex," wn here, is now extensively used for nd-deadening, insulating, damp-proofing, as a preventive of condensation, and for nstical purposes. It is made from the e of sugar cane, and is used in the form boards about ½ in. thick. For the pur-es mentioned this material is stated to be erior to cork, and it is supplied in a matt sh that may be treated with paint, dis-per, or any of the usual wall covering erials. In its natural state it is quite a sant tan colour, which for certain purposes d not be covered at all.

rederick Parker, Ltd. (Leicester).—STAND No. 60.—Mixers for concrete and tar-macadam and a comprehensive selection of road plant are shown on this stand, designed for economical working, and to withstand hard wear. In concrete mixers a new model, the "O.C.," is shown, we believe, for the first time. It has a capacity of 7 cub. ft., of the open drum type that is now generally favoured, and driven by a 3½ h.p. Lister engine. The machine is fitted with a loading skip which may be used for either side or end loading by one simple operation, a great convenience on many jobs where space is restricted. For smaller users there is the handy "Little Giant" mixer, also of the open drum type, but with a capacity of 4 cub. ft. This is built on the same sturdy lines as the remainder of the plant shown, and needs only 1½ h.p. to drive. Two stone-breakers are shown, a strong but light machine designed for breaking hardcore and soft stones, and a solid body machine for the heaviest work

Thos. Parsons & Sons (315–17, Oxford-street, London, W.1).—STAND No. 36.—As usual at exhibitions, Messrs. Parsons' display their colour products in a very attractive manner. Here a feature is made of "Parso-glaze" in decorating, and a new method of stippling with rubber stipplers. Some very fine results are achieved with this undercoat by the use of the new stippling process, as may be seen from the panels, balustrading, &c., on view that have been done in this manner. It is applicable, of course, to all colours, and a wide variety is shown.

Perkin & Co., Ltd. (Lord-street, Leeds).—STAND No. 29.—Although now so widely used, the "Rapid" stair housing attachment shown by this firm is attracting much attention and interesting builders who have not yet seen this small but valuable item of plant in operation. The advantage of this attachment is that it may be fitted to any make of spindle moulding machine, and avoids the expense of a separate machine for many purposes hitherto only possible on an overhead router. The attachment is shown in operation, proving the maker's claim that it will rout a pair of 15 in. rise strings in 25 minutes, and turn out a clean job.

Thomas Robinson & Son, Ltd. (Railway Works, Rochdale).—STANDS Nos. 39–40.—Builders will be particularly interested in two new woodworking machines shown here. One of these is a new type of tenoning machine which will do single and double tenoning and top and bottom scribing at one operation; it is, we are informed, the first machine made that will carry out these operations simultaneously. Another machine of special interest is a new type of planing and thicknessing machine fitted with a chain drive, and with a capacity of 130 ft. a minute; the machine is for planing, surfacing, thicknessing, edging, tonguing, grooving, and moulding. In addition to these machines, the stands exhibit a wide range of the woodworking machines for which the firm is well-known, covering every type of machinery of this character for the use of builders, joiners, and mills.

J. Sagar & Co., Ltd. (Canal Works, Halifax).—STAND No. 61.—Another comprehensive selection of woodworking machinery is demonstrated in operation here. There is the usual range of machines that have proved their worth for many years, and which are extensively used, and in addition one notices many improvements that add to efficiency and economy of working. A new machine here shown is a stair-trenching and recessing machine, while the remainder of the exhibits include machines for every woodworking operation.

Scaffolding (Great Britain), Ltd. (43, Lansdowne road, S.W.8).—STAND No. 59.—The full-scale model of their well-known scaffolding, on which many of their devices for simplifying erection are exhibited, makes one of the most imposing shows, and is particularly interesting because just outside the Exhibition, in Deansgate, it may be seen in actual use on a very large building in course of construction. The exhibit comprises tubular scaffolding, suspended scaffolding for steel-frame buildings of the type that has frequently been referred to by architects who have visited America as so full of possibilities for expediting and cheapening building work, scaffold ties, &c. The company's steel shuttering, known as "Conforms," is also shown in sections; one section showing its application to walling and the simple fixing devices, and another showing its use for casing steel columns. In the latter case the forms are fitted with an ingenious device by which the forms can be readily adjusted to different size columns, and with another device that automatically ensures that the steel stanchion cannot get out of centre.

Standard Metal Window Co. (Houghton-street, West Bromwich).—STAND No. 94.—On this stand are to be seen a large number of samples of metal windows such as have been supplied to Government Departments, the London County Council, and other local authorities. Steel windows, in standard size for all purposes, are here to be seen, from small casements for housing schemes to large windows. There are also exhibited steel partitions, wood frames for steel windows, leaded lights, and other types of steel fireproof fittings.

Thames Board Mills, Ltd. (Purfleet, Essex).—STAND No. 27.—The multifarious uses of a reliable fibre wall board for both utilitarian and decorative purposes are admirably demonstrated on this stand, which makes a special feature of the variety of attractive surfaces and colours in which it may be used. "Essex Board" is supplied in thicknesses from 3-16 in. to 5-16 in., and in various widths and lengths. The effects to be obtained by panelling, painting or distempering without preliminary treatment are shown, and the great rigidity of the material may be tested by those interested. The manufacturers emphasise the resistance of this type of wall-board to conductivity of heat and cold.

Turner Bros. Asbestos Co., Ltd. (Trafford Park, Manchester).—STAND No. 48.—Whether he be interested in the economical construction of a large industrial building or a small house, the architect and builder will be interested in the wide range of asbestos cement products shown on this stand. The firm's "Trafford" tiles are shown in different colours, and the simplicity of erection demonstrated, A special display is made of asbestos sheets, made to represent wall tiles, and applicable for lining walls of bathrooms, lavatories, &c. These are made in sheets measuring 48 in. by 48 in., and the saving effected in fixing these sheets compared with small tiles will be realised. The surface is highly glazed, and in various colours and patterns. Another feature worthy of attention is a new asbestos-cement roofing tile for domestic purposes, the effect of which may be seen on the roof of the stand.

Wadkin & Co. (Green-lane Works, Leicester).—STAND No. 33.—Woodworking machines for all builders' and joiners' requirements are to be seen here, with several improvements since they were last shown at a public exhibition. They are all high-speed tools, for which an exceptionally large output is claimed, ranging from inexpensive mortising machines to multiple-operation machines. The exhibits, which are all shown in operation, include a 42 in. roller-feed saw bench, with a variable speed gear-box; a cross-cutting and trenching machine, the feature of which is the motor mounted direct on the saw spindle; circular saws; a combined chain and hollow chisel mortiser, in which both tools are fitted with clutches, so that either may be stopped independently when not in use; spindle moulding machines, &c. A heavy tenoning machine, taking material up to 24 in. by 6 in., is fitted with scribing spindles and a cutting-off saw.

Wm. Wadsworth & Sons, Ltd. (Bolton).—STAND No. 20.—This firm has concentrated on a thorough demonstration of a patent lift which revolves as well as ascending and descending. This lift provides, in fact, not only a lift, but a turntable on every floor of a building, and its value in the loading and unloading of goods in a warehouse will be readily realised. It should also prove valuable in garages in which cars are taken from road level to a basement or upper floor. The lift is so designed that cars may enter or leave it at any point of a circle. Other exhibits demonstrate the fine finish of the components of the lift and its gear.

THE NATIONAL FEDERATION OF HOUSE BUILDERS

On Friday last, this Federation held its annual conference at the Hotel Cecil, when the President, Mr. J. W. Comben, delivered his presidential address to the members. This was followed by a conference on the subject of the erection of small houses by private enterprise to let to tenants and the discussion of recommendations to the Government with a view of making the same a business proposition. This latter discussion was opened by a paper from Mr. Henry P. Dallow, F.I.O.B.

The President, in the course of his address, said that since 1919, when housebuilding restarted after the war, down to March 1, 1927, there had been erected a grand total of 851,886 houses. Of these, the Government and local authorities had built, by contract, or by direct labour, 300,217; and private enterprise had completed the balance of 551,669. There were two kinds of private enterprise houses included in that figure, "State assisted" and "independent," and it was found that 230,620 State assisted houses had been built, and 321,049 houses erected by builders without any public help and sold to people who had been able to solve their own housing difficulty. The Federation in these difficult years had had to give a large amount of its energies to the matter of State assistance, but that could not be avoided. But the future of the industry did not lie with State assistance. In fact, he (the President) was sure the housing problem would never be solved by the subsidy—it was only a panacea, it was not a remedy, and they must get back to normal working, a free market, and a fair field for private enterprise and competition—for only by competition did progress come. The Government had a great opportunity when the Rent Restrictions Act expired. If builders could get rid of all the restrictions and subsidies and subsidised competition, they could build the houses and the house-builder would solve the nation's difficulty. The subsidies were unfair to the public which had to pay them, unfair to the builder who had to pay high prices all round because of them, and unfair to the buyer whose independence was always sapped by getting something for nothing. The only State assistance which should be continued was that of loans on mortgage on generous terms to thrifty people who could thus lay the foundations of independence; and that side of the Ministry of Health's activities should be developed intensively. He thought that private enterprise would be unable to erect houses "to let" until the Rent Restrictions Act was removed, and the confidence of the investor restored. Such removal of the Act might cause temporary difficulties, but public opinion, backed by exposure in the Press, would abate injustice, and keen competition amongst builders would soon ease the position. The Federation, he concluded, was a specialised organisation. They did not attempt to deal with any other branch of their industry except housing. It existed to promote the building of houses by private enterprise. The organisation was working for the restoration of confidence on the part of investors, and was pressing for the simplification and economical administration of local by-laws and building regulations, the building of dwellings of the most healthy and economical types, and to encourage the occupier owner. The Federation was going ahead in numbers, finance, status and influence, and the Minister of Health did them the honour of consulting their committee on several occasions before announcing the reduction of the subsidy as from October 1 next. Unfortunately he did not follow all their recommendations.

In opening his paper, Mr. Dallow said we were faced to-day with the fact that, so far as building houses to let for the working classes was concerned, this had virtually passed into the hands of the Local Government authorities. Building houses to let was a business similar in many respects to any other business. It needed capital, labour and materials, but there was a difference, inasmuch as while in other businesses the turnover was assured, the builder could only sell a small proportion of his house, and had to let the remainder. Coming to the position to-day, it had to be admitted that the Conservative Government had set up a splendid record. The house-builders had received from that Government a very great amount of assistance, and private enterprise had to a large extent been re-established. On the other hand, the local authorities had been induced by the Wheatley Act of 1924 to build houses to let by the provision of a large subsidy and what would appear to be an unqualified permission to saddle the taxpayer with a large proportion of the cost for years to come, and instead of private enterprise being encouraged it was being suppressed in favour of those socialistic schemes. There was, said the speaker, no more reason for municipal housing than there was for municipal coal, municipal boots, meat, bread, etc.

The speaker knew a case where the local authority had refused to grant subsidies to private builders for selling, and yet built houses themselves for letting. It was impossible for private enterprise to build houses to let under the 1923 Act in competition with the local authorities under the 1924 Act. The local authorities could afford to offer their houses at several shillings a week cheaper because of their ability to charge the community with the loss. Supposing that builders had the same facilities for borrowing money as municipal authorities, that was to say, could borrow money at a low rate of interest up to 85 per cent. of the cost of the houses, that would enable them to build houses to let, but of necessity they would have to have a say in the fixing of the rents. Then there was the question of the removal of the subsidies. If they had to go, the speaker would not be sorry. The high price of materials and the shortage of apprentices were two evils aggravated by the existence of those subsidies. He knew they had been necessary, and would go so far as to say that private enterprise could not have been established without them, nor houses provided for the people; but they were never intended to last for ever, and present circumstances were different from what they were in 1923. Confidence and credit were more important than subsidies, and the Government could give the builder confidence by assisting him financially.

In conclusion, the speaker said that until builders could see local authorities reverting to the plane they had previously occupied, and they occupying themselves the place they should, building houses to let would be a socialistic monopoly with dire consequences. At the very least local authorities should have no better terms than what the builder could get. There was no argument in favour of them being allowed to compete with builders at all, any more than with the producers of all other commodities. If the subsidies had to go, builders would at all events all be building on the same basis instead of an augmented subsidy in one area and the bare subsidy alongside, as is the case in many districts to-day. Healthy competition had been and always would be the only means of bringing the cost of an article down to its economic level. Moreover, it was the proper means of meeting the public demand. Builders should be allowed to build at twenty or more to the acre and should be allowed a fair loan on easy terms of interest, say, 4¾ per cent., and a liberal valuation without restrictions. Lastly he suggested, as a means of assisting the working classes to rent the smallest houses, the local authorities might allow them to be rate free for a short time and subject to a graduated rate for a further period, until s time as the cost of building was reduced.

Discussion.

Mr. A. J. Belton, the retiring Preside moved a vote of thanks for the Preside address. While agreeing that the sooner subsidy was reduced the better, there w he said, bound to be a certain dislocation. was better, he thought, to have had the s sidy in the form they had had it, even i had put up building costs, than t thousands out on the dole.

Mr. E. R. Jones, of Liverpool, in seco ing the vote, said that the duty of ho builders was to supply public service, they had justified that up to the hilt. emphasised the need builders had to k their capital free. It was their job to mu ply houses and the Government should ca on with the mortgage business. Build could supply the right houses if the Gove ment would grant the right mortgage wh he, the speaker, gave as 30 years, to re and interest in the nature of 4 per cent.

In the general discussion that follo Mr. Dallow's paper, Mr. H. R. Selley, L don County Council, said that the Wheat Act of 1924 was framed specially to keep individual builder out. What private build wanted was cash at the start, not a s sidy extending over 40 years. He did agree with Mr. Dallow's suggestion that poor should be let off the rates. That v only another form of subsidy, and a v vicious one. He also thought that lo authorities should not poach on the priv builders' preserves. The former should st to the building of that type of house tended for the very poor and leave the v alone.

Mr. E. R. Jones said the industry was a confused state because they were try to mix two things. The problem was only housing but rating. The latter was an entirely wrong basis. The basis curr to-day was that a house should be valu not according to the rent actually paid that house, but on the rent paid by a hypot tical tenant. He thought the house sho be assessed as were the nearest control houses under the Rating Act.

Mr. D. R. Day said he had long advoca the abolition of the subsidy. What was quired was to get the building industry b to being an attraction to investors, and that end it was necessary that the rent strictions should be abolished.

Mr. H. R. Selley, speaking regarding density, said it was difficult to town p built-up areas because the value was of very great; anyway, one could not sw away areas by a stroke of the pen. In ar adjoining park land, belts or areas adequa supplied with open spaces, he could see reason why 20 or even 32 houses should be built to the acre. The L.C.C. had ideal housing estate with 32 houses to acre.

Mr. Norman McKellen then proposed following resolution which, on being put the meeting, was carried without dissent:

"That the Ministry of Health be urge take into consideration the question of ass ing private enterprise to build houses for to the investing public to let to tenants, in particular to make provision for

"(1) Houses to be permitted to be bu up to 20 to the acre;

"(2) Loans to the owner in mortgage to 90 per cent. of the cost, at a rate of terest closely approximating to that pay by the borrowing authority;

"(3) The withdrawal of all wartime strictions and the restoration of confidence the part of the investor;

"(4) Rating to be fixed on the basis pre-war houses of comparable size;

"(5) Any other concession which may found necessary;

"And the Federation expresses its de to confer with the Minister with the ob of arriving at a workable basis."

LAW REPORT

KING'S BENCH DIVISION.

Before Mr. Justice Greer and a Special Jury.

BUILDERS' ACTION FOR ALLEGED LIBEL ON QUESTION OF WAGE-RATE DEFAULT.

Bovis Ltd. v. Thorne and Others.

ON March 23 this case came on for a re-rial, it being an action brought by Bovis, Ltd., builders and contractors, of Berkeley-treet, W., against five defendants, officers nd members of the London Master Builders' ssociation, to recover damages for alleged ibel. The defendants were Mr. Fred Thorne who was president of the London Master Builders' Association in 1925), Mr. H. T. Holloway (ex-president of the Association nd managing director of Holloway Bros.), ir Walter Lawrence (a member of the Council of the Association and a member of he firm of W. Lawrence & Son), Mr. E. . Brown (director of the Association and a alaried official), and Mr. W. J. Rudderham secretary of the Association).

The case originally came before Mr. Justice Horridge and a special jury. His lordship uled that there was no case to go to he jury on the question whether the words were capable of the defamatory mean-ng, and directed the jury to find for the efendants, for whom he entered judgment. From this result Messrs. Bovis, Ltd., after-wards appealed to the Court of Appeal when new trial was directed.

(The proceedings before Mr. Justice Hor-idge and in the Court of Appeal were fully eported in *The Builder*.)

Sir John Simon, K.C., Mr. R. A. Willes, nd Mr. Gluckstein now appeared for the laintiffs; Mr. Stuart Bevan, K.C., Mr. owitt, K.C., and Mr. Rimmer for the de-endants; and Mr. Blanco White represented he Royal Institute of British Architects (in-tructed by Messrs. Markby, Stewart & Wadesons).

Sir John Simon said the wrong which the laintiffs had suffered was in April, May and June, 1925, when a series of alleged libels were issued by the authority of the London Master Builders' Association. It was in effect broadcasted that the plaintiffs were what was called "in wage-rate default." He submitted that was a most injurious re-flection upon the plaintiffs. It was a false-hood, and he would prove that they had suffered to the tune of thousands of pounds. The only excuse that could be made was that he defendants had set up a special meaning of the phrase, "in wage-rate default," which, according to their private dictionary, meant hat the plaintiffs were not prepared to sign document that they would do exactly what the Association told them to do. Bovis, Ltd., were apparently new-comers amongst he London builders. In 1923, when they were members of the Association, they found hat the Association was not acting fairly as between some of the old-established firms nd a firm like Bovis, Ltd., in regard to the etting of tenders. In October, 1923, Bovis, Ltd., were not members of the Association nd were under no obligation to obey the orders of the Association. In the summer of 1923 there was a great shortage of building abour. It was not a question of getting men at lower than the standard rate of wages. Good men could be got if they were paid more than the standard rate of wages. Though a great fuss was made about Bovis, Ltd., paying more than the standard rate of wages in some cases, that was being done by other members of the Association in an underhand way by giving a sum at the end of the job. After the plaintiffs resigned from the Association they found a difficulty in getting permits for overtime. It was not the business of the Association to give per-mits, but the plaintiffs found that when they asked for permits they were told they were not members of the Association. Bovis, Ltd., had refused to sign a form known as "Form A" agreeing to pay the standard rate of wages and to carry out the directions and instructions of the Association with regard to all matters relating to trade disputes. Be-cause of that refusal the statement was broadcast that Bovis Ltd., were in "wage-rate default." In fact, when the alleged libels were published Bovis, Ltd., were pay-ing the standard rates and no more. Mem-bers of the Association had also refused to sign "Form A" and other members paid more than the standard wages; but the Asso-ciation never circulated a statement that any of its members were "in wage-rate default." Bovis, Ltd., were doing an increasing busi-ness, but after the alleged libel the stream turned the other way, and the actual loss to the company apart from the damage to repu-tation was from £18,000 to £20,000 in the next 12 months.

Mr. Sidney Gluckstein, one of the directors of Bovis, Ltd., gave evidence to the effect that the statement complained of had done the company serious harm. In cross-examination, he admitted that the breaking away of the firm was no doubt embarrassing to the building trade, but he disputed that it involved an increase of cost to the building owner. He admitted that for a month he exceeded the standard rate of pay to half-a-dozen bricklayers out of some thousand em-ployees. It was a special job, and he wanted an increased output.

Mr. Bevan: Was not the real reason why you resigned from the Association in October, 1923, the fact that you found in some cases it suited you to pay something in excess of the standard rate?—No. It was not. I only paid on one job. I did not pay afterwards.

Witness said that the contract was for Chesham House. It was a £300,000 job.

Mr. Charles Edward Wright, a bricklayer, of Chesterton-road, Plaistow, gave evidence of having been in the employ of Messrs. Rice & Sons, who were engaged at Verrey's Res-taurant in Regent-street, in July, 1925. He was paid 1s. 10d. an hour, which was 1d. above the standard rate.

Mr. George Macfarlane, another bricklayer, gave evidence to the effect that when he worked for Lawrence & Son at the Marine School at Watford at the fall of last year he received 1s. 9½d. an hour. He expected 1s. 9d. for that area. He did not work a full week because the fare was too expensive, and he returned to Bovis, Ltd.

In reply to Mr. Bevan, the witness said he did not know if there was a suggestion that Watford was just outside the London area, and that was the reason he was paid 1s. 9½d.

Mr. Digby L. Solomon, F.R.I.B.A., gave evidence as to receiving the circular com-plained of. He said it referred to certain firms, amongst them Bovis, Ltd. He did not know at that time anything about the by-laws.

Mr. Samuel Geo. Joseph, a director of Bovis, Ltd., and Knox, Ltd., gave evidence that the latter firm was registered at the be-ginning of 1923, and the greater part of its share capital was owned by Bovis, Ltd. The total turnover of contracts by Knox, Ltd., in 1924 was £17,000, and in 1925 £28,301. In addition they had the contract for the Regent-street Polytechnic of about £48,000. Witness stated that Mr. Thorne had told him that some members of the Association had not signed Form "A," but he was sure they had.

The witness referred to a large contract the firm was completing at Chesham House, Regent-street, and said that when he tried to get other contracts he failed because of the alleged libellous statement that was going round. In the year before the alleged libel, during which there was an unofficial boycott, the figure for contracts by the firm of Bovis, Ltd., and Knox, Ltd., amounted to £445,000. In the following year, when the alleged libels had appeared, the figure was £283,000, and in the next nine months, when plaintiffs' complaint had come before the public, the figure was £555,000.

Mr. Frederick Charles Mitchell, a Licentiate of the R.I.B.A., practising as Messrs. Burd-wood & Mitchell, at 80, George-street, Port-man-square, W., examined, said he received and read the document sent out by the Asso-ciation on April 8, 1925. He knew the firm of Bovis, Ltd., and had employed them before he received the document. There was no valid reason why he should not have con-tinued to employ them, but he did not do so for a few months because of the notice in the document that they were in wage-rate de-fault. At the foot of the communication was a note that it was contrary to the rules of the Association for its members to tender in competition with firms which were in wage-rate default.

Mr. E. F. Q. Henriques, a solicitor, examined, said he found that there were over 80 members of the London Master Builders' Association who did not sign "Form A," under which the members agreed to pay the standard rate of wages and to obey the in-structions of the Association.

This being the plaintiffs' case, Mr. Stuart Bevan opened the case for the defence. He said that all the defendants took full respon-sibility for the publication of each of the documents complained of. Their immediate concern in the matter was to clear themselves of the calumny put forward through Sir John Simon on the plaintiffs' instructions. The charges so made not only could not be sus-tained but they ought never to have been made. The view of the defendants was that the offering of higher wages by one builder than those offered by another and the coun-ter attack against that was disastrous in its effect on the industry. That process, if per-mitted and indulged in, led to increased cost in building, and no better example could be found than the one furnished by the plaintiffs, when, on the occasion of the general strike, they acceded to the men's demands with the result that the owner had to pay three per cent. more on the contract price. It was the building owner who suffered. That course of raising the rate of wages would be disastrous to the public interest. The standard wage had been fixed by national agreement, and the mischief was that if a builder broke away from that agreement and paid more than the standard rate it would have the effect of luring away the workmen of another builder who had his tender accepted on the basis of the standard rate. That view for years was shared by the plaintiffs, although they dissented for a time. They came back to it, however, until October 17, 1923, when they resigned from the Association. That resignation, they said, was prompted by the dissatisfaction at the way in which they were treated on the question of overtime permits, but it was apparent that at that time they had decided to pay wages in excess of the standard rate. In June, 1925, after the pub-lication of four out of the five alleged libels, they wrote that they did not desire to revive old controversies, but that they recognised the Association's objection to firms paying pre-miums for the labour they required in the present period of restricted supply. He (counsel) contended that the plaintiffs had suffered no damage by the publication of the alleged libels. He said that if they had suf-fered at all it was because certain members of the Association had refused to tender against them. He proposed later on to ask his lordship to rule that the occasions on which the alleged libels were published were privileged.

Sir John Simon said that that submission should have been made at the close of the plaintiffs' case.

His lordship said he gathered that Mr. Bevan was going to make his submission when all the facts were out, some of which might be proved by the defendants' wit-nesses. The defence was that every one of the documents complained of was published on a privileged occasion, and he could not decide that until he had heard both sides.

Later on the learned Judge said he was clearly of opinion that the publication to the

members of the Association, to associated institutions federated with the members, and to the architects was privileged. The publication to such bodies as the L.C.C. and the Metropolitan Police and public bodies of that kind was also privileged. He could not, however, say that privilege extended to the other persons to whom the documents complained of had been sent until he had heard further evidence. As regarded a large part of the case, it was necessary for the plaintiffs to establish malice.

Mr. Bevan said he could submit privilege in the case of the other persons later.

His lordship agreed.

Continuing his address, Mr. Bevan contended that he was entitled to succeed in all those privileged cases unless the jury found that the defendants were actuated by malice. There was no ground for that suggestion. To find malice the jury must find a conspiracy extending among a large number of members of the building trade. The phrase "wage-rate default" was no evidence of malice at all, because when they looked at the correspondence they saw that "default" was not used in the ordinary meaning of that word. He proposed to show that the plaintiffs had suffered no damage by the use of those words.

Mr. Ernest James Brown, examined, said he had been a director of the London Master Builders' Association for the last eight years. Practically speaking, they had never had peace in the building industry since the war. In 1920 between 340 and 350 employers were members of the Association. Everyone who counted was in the Association. The lack of labour made the trouble infinitely worse, and the men were thereby in the best position to fix wages. That tended to lead to such a soaring of prices that it might in course of time stop the industry.

In May, 1920, the National Agreement was entered into on behalf of the Association, and he took a large part in bringing it about. The National Wages and Conditions Council was set up, wages and hours were fixed, and it was provided that both sides should adhere to the agreement. During 1921 and 1922 applications were made by the operatives to vary the terms, and whenever any alteration was made it was in favour of the men. In February, 1923, the Association passed a resolution instructing their representative on the National Council to press for longer hours and a reduction in wages. When the matter came before the Council it caused a crisis in the trade and the employers decided to post lock-out notices. Later in the year the plaintiffs resigned from the Association. He (witness) denied that he ever treated Bovis, Ltd., differently from any other members of the Association; they were on extremely friendly terms, and before this action Mr. Gluckstein and Mr. Joseph had never charged him with bad faith in his treatment of them. The Association had no power to give overtime permits without the permission of the operatives. He had no objection to Bovis, Ltd., getting permits. He could have vetoed them, but he agreed that they should be granted. In 1924 trouble started in Liverpool, and there was a big lock-out in London. At first the plaintiffs supported the policy of the Association, but afterwards they took the men back at a ½d. an hour more than the other employers had agreed to give. That was most detrimental to the masters. It weakened their position and the men began to hoist the flag of victory. When it was found that Bovis, Ltd., were paying more than the standard rate of wages, the members of the Association decided that they would tender in competition with firms who were paying the standard rate or not at all. The object of that decision was the stabilisation of wages. Witness admitted that the Association had received complaints that certain firms were paying more than the standard rate. When they were able to verify the truth of such complaints, they put the offending firm in order. After the trouble in 1924, the Council of the Association formed a special Committee to consider the question of wage stabilisation, and in November it was decided to amend the rules. By-laws were adopted and another special committee was formed to carry out the procedure relating to unfederated firms. "Form A" was sent to all members of the Association and to thirteen non-members, including the plaintiffs. Anyone who did not sign the form was declared to be in wage-rate default if it were known that he was paying more than the standard wages. On March 25, 1925, at a meeting of the special committee, three of the defendants being present, definite information was forthcoming that Bovis, Ltd., were paying more than the standard rate of wages, and it was decided to send them "Form B," which called on them to sign "Form A" within seven days. On April 8, no reply having been received from Bovis, Ltd., it was decided to declare that that firm was in wage-rate default. He was not aware that at that time Bovis, Ltd., had posted a notice at their works that they were discontinuing the payment of more than the standard wages. Had he known that he would have welcomed the news that they were coming into line with the other builders and would have taken steps to stop the notice that the firm was in wage-rate default. The notice was sent to the members of the Association, to architects and quantity surveyors in the London area, and to public bodies, such as the War Office, the Admiralty, the Office of Works, and the Air Ministry. The circular was sent to the Secretary of the Surveyors' Institution that he might advise his members what course they should pursue in view of the crisis which had arisen. It was also sent to the engineers of a number of big companies.

His Lordship: Before the Forms were sent out was the boycott continued?—It was continued down to a certain date.

Mr. Willis: I will give you the date. You declared the plaintiffs in wage-rate default on January 29, 1925. Did you in that month secure the unofficial boycott of an architect named Ferrier?—I do not know what the date was.

You knew all about the Ferrier case, which was investigated by your Association?—Yes.

Referred to a letter from Messrs. Holloway to the architect on January 8, the evening before the tenders were sent in, in which they said that it had only just reached their ears that Bovis, Ltd., and another firm had been invited to tender, and that they (Holloways) felt so strongly on the subject that they must refuse to tender with those firms until they came into line, the witness replied that he did not write that letter.

I suggest to you that that letter of Holloway's was one of a number of letters sent by individual members of the Association to the architect, saying that they would not tender and that that was done to make it appear that the members were acting on their own responsibility, whereas it was the action of the Association?—If you take it in that way.

His Lordship: Do you know where other members wrote similar letters?—I cannot say.

Mr. Willis: Did not the Association want to deal with the complaint of the architect who said that the boycott had come on him as a thunderbolt just as the tenders were about to come in?—I believe that is what happened.

Mr. Willis: If the document read fairly said of Bovis, Ltd., in April, 1925, that they were "defaulters" because they had broken some rule of the Association, that would be untrue?—Of course, it would be untrue.

His Lordship: You knew that they were not members bound by the rules, and therefore that they had not broken them?—Yes.

His Lordship: Bovis, Ltd., made a fair proposition to you under which you could have withdrawn your circular without loss of prestige.

Mr. Willis referred to a letter from the plaintiffs in which they said defendants must withdraw the circular, and in order that they might do so without loss of prestige they had prepared what they thought was a suitable memorandum to be published by the Association.

His Lordship (to the witness): As fair-minded men, why did you not send out that document? It would have cost you only a few three-halfpences.

The witness replied that the receipt of the plaintiff's letter was reported by the president to the next meeting of the Association.

Mr. H. T. Holloway, one of the defendants, also gave evidence and denied that he was actuated by any ill-feeling or spiteful motive against the plaintiffs.

His Lordship told counsel that there might be certain architects to whom the alleged libel was sent in respect of which there might be no privilege.

Mr. Holloway, in cross-examination, agreed that the circular of April 8, 1925, was not fair if it conveyed to the minds of the persons receiving it that the plaintiffs were "defaulters" in the ordinary sense of the word.

[The case is proceeding as we go to press.

THE NORTHERN POLYTECHNIC

Mr. R. L. Roberts, M.A., Chairman of the Governing Body, took the chair at the Northern Polytechnic, Holloway, N., on Friday last, when Mr. John M. Gatti, Chairman of the London County Council, opened the new building attached to the old school.

The Chairman, in the course of his statement, said that the building was not absolutely complete, but it had been decided to open it, firstly because it coincided with their annual conversazione, and secondly, because the need for more space was too pressing. The old buildings were quite inadequate in size, and both students and teachers were badly cramped. In spite of that, however, there had been since the opening year an annual increase of 10 per cent. He felt that the embryo craftsmen of the building trades of North London would have to look to this Institute for their building education.

Mr. John M. Gatti then delivered his address, in the course of which he said that the chairman had made clear to them the circumstances of the rebuilding necessary. £21,000 had been granted by the L.C.C. for this extension work—money which was granted freely because the Council recognised the value of the work the Northern Polytechnic was doing. He believed that there had there 400 whole-time students, 200 part-time students, and no fewer than 2,500 evening workers, and the roll was still increasing. That was a record on which the Council was ready to congratulate them. Should further extensions be required, they could be sure of the utmost sympathy from the London County Council. The Polytechnics stood for the ideal of providing opportunities for the very best technical training that could be given. More than ever in these days of world competition should our young men be educated in the highest developments of the professions.

His Worship the Mayor of Islington, in proposing a vote of thanks to Mr. Gatti, said that the value of the Polytechnic was known to all. He would like to congratulate Mr. Gatti on his appointment to the Chair of the London County Council.

Sir Lulham Pound, Bart., in seconding the motion, said that the school was a leading force in architectural and building education.

Capt. O. Wakeman, M.A., Chairman of the L.C.C., Higher Education Sub-Committee, proposed a vote of thanks to the Chairman, and Mr. G. H. Gater seconded. The latter said that Mr. Roberts in the past two years had considerably aided the carrying through of the new building by his energetic conduct. He would like to express on behalf of himself and his colleagues how much they owed to him.

Mr. Gatti then opened the new building and proceedings terminated with a view of the various exhibits of craftsmanship, drawings, &c., done during the year.

In the Principal's report for the session 1925-26 it was stated that the great success of the architectural and building department was partly due to the fact that the head, Mr. Bennett, was himself in practice as an architect and in close touch with the building trade, knowing by experience the qualifications desirable for students entering architects' offices.

RATES OF WAGES IN THE BUILDING TRADE

(For rates of wages in the Building Trade in Scotland, see page 546)

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

Following is a list of abbreviations:—Borough Surveyor, B.S.; Borough Engineer, B.E.; District Surveyor, D.S.; Clerk, C.; Town Clerk, T.C.; County Engineer, C.E.; County Surveyor, C.S.; County Architect, C.A. Surveyor, S; Engineer, E; Borough Architect, B.A.; Architect, A.

TRADE NEWS

Domestic Boiler Travelling Exhibit.

The National Radiator Co., Ltd., of Hull, have, by arrangement with Messrs. Reliance Anthracite Ovoids, Ltd., had fitted to the latter's travelling caravan exhibit an "Ideal" Cookanheat No. 01 and an "Ideal" Open Fire Domestic Boiler, both connected to a hot water storage tank, so that either or both can be shown in working operation. This motor-caravan will visit during this year many of the leading agricultural shows in the South and West of England, and working demonstrations will also be given in numerous towns.

Space has definitely been booked at many agricultural shows, amongst them the Brighton and Hove Horticultural Society, at Brighton, April 6 and 7; and Oxfordshire Agricultural Society, at Oxford, on May 18 and 19.

The Company have also arranged with Mr. G. H. Burkhardt, the principal, for the exhibition of their film showing the manufacture of "Ideal" boilers and radiators, at the College, Victoria-road, Swindon, on April 6, at 7.30. A cordial invitation is extended to all architects and builders.

Belgian Contract for England.

An important contract for the construction of two reinforced concrete deep water quays on the Congo for the Belgian Government has just been secured by Messrs. Perry & Co. (Bow), Ltd. The contract provides for the construction of an entirely new port at Ango-Ango, a few miles below the existing port of Matadi on the left bank of the river, and also for the enlargement of the existing Port at Matadi. The total estimate for the contract is nominally equivalent to £350,000, but it is anticipated that extensions of the specifications and currency adjustments will bring the total expenditure to a considerably higher figure.

Bituminous Paint.

As the result of chemical research, a new bituminous paint, under the name of "Factotum," has been placed upon the market. Hitherto bituminous paint has had a limited use owing to the fact that it has only been possible to produce it in either black or indefinite dark browns. The makers of "Factotum," however, claim that this bituminous paint is being manufactured in all colours, and also in aluminium, gold, &c. A postcard to Metal Paint, Ltd., of Carlton House, Regent-street, S.W.1, will bring a sample of "Factotum" and full information concerning it.

Wood Flooring.

The "Zeta" Wood Flooring Co. (1910), Ltd., have, we learn, laid Caius College, Cambridge; Pembroke College, Cambridge, Newnham College, Cambridge; Marlborough College, Wilts. Barclay's Bank, Lombard-street; and Old St. Pancras Church, St. Pancras, with "Bennett's Patent bed grip and end tongue system."

Rust Preventative for Structural Steel.

The Wailes Dove Bitumastic, Ltd., of 5, St. Nicholas'-buildings, Newcastle-on-Tyne, have issued a comprehensive booklet in which are displayed the various uses to which their "Bitumastic" anti-corrosives can be put. Chief of interest amongst these for architects and contractors are the uses to which this compound may be put to prevent corrosion of structural steel work, or any exposed ironwork, such as bridges, colliery headgear, gas holders, corrugated iron roofs, &c. This booklet, which is likely to prove of value to contractors, will be gladly forwarded upon application to the company.

Paints and Enamels.

A comprehensive catalogue of their colours, distempers, paints, varnishes, enamels, &c., has been issued by Sir W. A. Rose & Co., Ltd., of 161, Cheapside, E.C. 2. Recent contracts completed include work done for the Admiralty, R.A.F., H.M. Office of Works, India Office, and Foreign Governments, as well as nearly seven hundred public authorities in Great Britain. The catalogue, together with shade-cards, will gladly be sent upon application to the makers.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach him not later than Tuesday evening.

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

CXXXII.—No. 4392. APRIL 8, 1927.

TO-DAY

has become a platitude to say that we in this country are a conservative people, though the banality of the saying may be much relieved in the many aspects from which this state may be viewed and reviewed. We are, in fact, half-proud of our conservatism, and half-ashamed and there may be times when it does indeed merit these measures of pride and shame. We may profess to scorn ictorians, and to parade our shingled morals, but the fact ns that more often than not the sophisticated man-about- may still feel the conventions outraged at the modern and the Red revolutionary may still feel an itching of the to touch cap to privileged authority. So strong are the that drive back into a stable past.

nd surely it is a fine thing to have a firm base upon which id life may spring, and our conservatism is, after all, but xpression of a fact, rather than of our fancies of one. same eternal elements which force their expression into re bound to show themselves in a like measure in art. out a stability to stand against all those elements in rnism which are heretical there would be nothing left but ry. To reach back into the past among the theories of resent is to find the stability of the Pyramids, while to ine a self-sufficiency in the present is to wander in a by-way lse romance, a topsy-turvyland where logic tells a joyous nd convention is left at the door, like an umbrella in the sh Museum vestibule.

it here that our Latin friends and neighbours are about d themselves? Mr. Howard Robertson, in his brilliantly inating paper read before the Royal Institute of British tects a short while ago, did not tell us, for he could tell nswer no better than can we. What he did tell us, in an rably broad-minded way, would incline us to accept this me modern movement in France as a sincere quest after sty, and if the specialised character of the paper has not ved us, there is little doubt that the movement has taken n grip upon the imagination of the French architect of y.

here is much to recommend a revolt against humbug, ded another and greater humbug is not to take its place. s reminded of Stevenson's fable in which a people, shackled e right leg, invoked magic to remove the chains, only to hem transferred to the left, and with the right leg still raw the original state. It is clear that in yielding to the ction of this modern movement we do well to think all l the subject before committing ourselves to an unreserved ration. It is better to do so than to pretend to a forced ference.

hat are the salient influences that have brought this type ench modernism to the front? If we have understood Mr. rtson aright, we are asked by the French modernist, first, ree that ferro-concrete is the principal medium of modern tecture; secondly, to recognise that the boundless possi- es of the material are without precedent, and must be ssed without precedent; and thirdly, that there is a spirit action in French architecture which needs the stimulus of w movement. Let us not be too ready to accept these cently reasonable hypotheses upon their face value.

ooking back into history, not for copy but for the frame nd in which modern work is likely to be judged by posterity, nd, surely, that it is those works undertaken with the ne purpose of the spiritual or secular glory of the age that have struck the note for current architecture of the every-day type. Such buildings were built, aiming as nearly at the eternal as the powers of the builders would permit, and in what was thought to be the most permanent materials available. If we are to take this as a rule, are we not a little hasty in accepting ferro-concrete, it has been asked, as a material fulfilling this purpose, and must not time be allowed to prove it as a centuries-lasting material? At any rate, can we permit it at once to dictate the forms of modern architecture? The questions are put merely for deep consideration and not as answers in themselves.

Again, in seeking the correct expression for ferro-concrete, are we not inclined to jump to the conclusion that the laws of structure have been so much revolutionised by this powerful new material? True, there is much that can be done with it that could not be done under old-fashioned methods, but surely we take liberties with it, not from choice, but when we must? The cantilever is still twice as wasteful, span for span, as the beam, and it is still desirable on purely practical grounds to carry down supports to the ground in rhythmical order wherever possible. Must we really renounce the Parthenon as the standard of material rightly and consistently placed? The suggestion that in singling out the apparent miracle of construction the French modernist is missing the expression of average modern structure is worthy of consideration.

Then, to those who have cherished an admiration of the Beaux Arts school, it is difficult to believe that French architecture has been in such a bad way as to need the doctor. It is a characteristic of this irrepressible people to give an expression to their architecture which gives a hint of the near approach of decadence, and their power of avoiding it is an equal characteristic. The history of French architecture is full of such occasions, and the present seems so much less critical than many that have gone before that we may be excused for fearing this movement as no more than a mischievous interruption. The proof that we are wrong may come, and come sooner than we expect.

Mr. Robertson does not argue for or against. He simply marshals his facts for us to argue upon if we will, and there was but one passage in this excellent paper which may seem a little disturbing, if too much has not been read into it. He suggested that the function of Corbusier was to stimulate the die-hards. We like this stimulus on paper, but we must confess we fear it in structure. The modern movements in other arts have made the same claim, but whereas the extravaganzas of the painter, the sculptor, the poet, the musician and the dramatist may be put out of sight and forgotten when the lesson has been learnt, that of the architect must remain with us always. The piquant caricature of to-day may be an empty, ugly joke to-morrow. In suggesting that architecture must be taken more soberly, we may be assuming too much as to the intentions of the architect, but it is a point that should not be forgotten.

Now, we should be guilty of an impertinence if we were to attempt to dictate what should or should not be accepted by the French architect of to-day. France can judge of her needs far better than can we. We cannot, however, remain indifferent to what is going on so near to us both in distance and in friendship, and we may be permitted to suggest, without offence, those lines of thought which we have sketched for our own consumption, before the attraction of something fresh is translated into thoughtless emulation in this country. Spontaneous naughtiness has its fascination for the onlooker, but it will not bear repetition; and, after all, we are a conservative people.

K

NOTES

The Liverpool Cenotaph.

On the question of the site for the Liverpool Cenotaph an architect writing to the *Liverpool Post* says, "Elmes never contemplated that any obstruction whatever would be tolerated on the Plateau, but these effigies were permitted in the bad old days when architecture was not appreciated." The great improvement of the Plateau by the removal of the Beaconsfield statue will do much to confirm these statements, which, we believe, will be endorsed by anyone who endeavours to judge the issue impartially.

"The Builder."

We referred in our last issue to the suggestion of another Liverpool architect that this journal is a builders' paper, and that therefore our opinion on the Cenotaph controversy is, presumably, to be discounted, and we expressed the belief that we could safely leave such a comment to the judgment of our readers. This judgment found expression in a letter signed "F.R.I.B.A.," which appeared in the Liverpool *Echo* of the 31st ult., in the course of which the writer mentions that our full title is, *The Builder, a Journal for the Architect and Constructor*, and adds: "and what is more, it is read by practically every architect of standing in the British Isles." We give his letter on p. 556, as we think we are entitled to put it on record in our columns.

Registered Architects.

Mr. Geoffrey Butler writes to the *Times* from the House of Commons to say that though every single point raised by Cambridge University in reference to the Architects' Registration Bill has not been met, "by far the major part of its suggestions have been adopted thanks to the courtesy shown by the Institute at every turn. I feel I am representing the Cambridge authorities in expressing their genuine appreciation." The Bill, which is down for second reading to-day, has been considerably amended since it was first published. The first part of Clause 5 now reads as follows:—"The following persons shall, without any other qualifications being required under this Act, be entitled to be registered and the Council shall cause their names to be entered in the register: (*a*) Architect members of the Royal Academy and of the Royal Scottish Academy; (*b*) every person who has gained a diploma in architecture from any university in Great Britain or Northern Ireland; (*c*) every person who at the passing of this Act is in *bona fide* practice as an architect; (*d*) every person (i) who was for a period of five years immediately prior to and is at the passing of this Act a *bona fide* architectural assistant; or (ii) who subsequently to the passing of this Act has completed a period of five years (one year at least of which period shall have been prior to the passing of this Act) as a *bona fide* architectural assistant; period during which such architect assistant has been engaged as a pup an architect or has been a student school of architecture recognised as by the Council shall be reckoned as of such period of five years."

"Wage Rate Default."

After nearly a fortni litigation, the action Messrs. Bovis, Ltd., brought against the Lo Master Builders' Association, has decided in favour of the Company. case turned upon the question a whether the words "wage-rate defa were ambiguous or contained an innue and the jury decided that they ambiguous and of a consequence libel Messrs. Bovis being awarded the su £25 as damages. The case shows cl the danger of making statements tha capable of carrying, whether so inte or not, a double-edged meaning w by the uninitiated may be misconstru

Defects in By-laws.

In the series of article have been publishing by-laws, it has not possible to set out n concrete cases of defects in by-law restrictive provisions the cause of h ship, but we think one fact has made apparent, which is, that Ministry of Health does not display spirit attributed to many Governm Departments of resenting innovations clinging to red-tape regulations.

Municipal Gardens, Southport: Detail of Entrance. Mr. A. E. Jackson, M.Inst.C.E., Borough Engineer.

The Speaker's House, Government of Northern Ireland, Ulster: General View.

MESSRS. RALPH KNOTT & E. STONE COLLINS, FF.R.I.B.A., Architects.

try, as is shown in those articles, been very vigilant in their efforts to local authorities keep their by-laws date, and a good example of the prise shown by that Department in ng to assist those concerned with the nistration of by-laws is given in the th article in connection with the mendation of the Committee on ing By-laws that powers should be to the Ministry to place an inter- tion on by-laws, by consent of the es, where plans have been rejected. Ministry, without waiting for powers, l a circular stating that where both es were agreed and were willing to o their rights to go before the Courts, Department would undertake this The Committee itself found that rge proportion of the complaints against by-laws brought before were founded on misapprehension really due to other causes and great ulty was experienced in running to grievances properly attributable to ws. There are many grumblings and lings, but specific cases are hard to re.

olicity of plaints.

We have good reason to know that the attitude of the Ministry is far from obstructive, that they are us to hear of real cases of grievance, nimated by a desire to perfect the nd welcome any helpful suggestions amendment; but we imagine their lties are very much the same as experienced by the Committee, many complaints prove either irrele- or unsupported by fact when closely ed into. Those most qualified to practical suggestions are often too engaged with their professional to have time to formulate them precision, and the grumble takes the of the well-founded complaint; but we cannot but feel that they would be rendering a public service if, when they come across real cases of grievance or hardship from the operation of any by-law, they would formulate them with precision, and bring them before the Ministry, and if our columns can afford any assistance we will gladly open them for formulated cases of complaint. If there is any prospect of the Public Health Acts being consolidated in the near future, it seems especially desirable that questions connected with by-laws should be thrashed out beforehand, for when a consolidating statute has once been passed, further amendments are both undesirable and difficult to secure.

Imperial Arts League.

THIS is one of those societies whose work carried on for the benefit of artists affords each year more abundant proof of its usefulness to them. As stated in the Report, "The League's Council are not required to show profits, but to administer usefully and economically as possible the funds which are annually placed at their disposal by the League's members," and of how serviceably to artists these funds are administered the Report gives ample evidence. Artists are not by temperament the best equipped for dealing with business affairs, and in a somewhat unworldly profession are at times the victims of fraud, which might not be attempted in the case of anyone else. Difficulties also arise owing to misunderstanding, and want of proper care in arranging their business concerns. This is perhaps excusable that the demands of the artists' work often override the necessary attention that should be given to them, and they are often very little able to extricate themselves in a difficulty. The protection offered by the League, at a very small annual subscription, relieves them of this responsibility and affords help in just the ways most needed. The lack of any combination between artists, in order to control to some extent the scale of prices, leads to unfortunate results through underselling, as a result of which prices are lowered and the general interests of the artist suffer in consequence. We look, however, less to combination than to more public spirit for the remedy of this particular evil. No doubt the time is coming when all young artists will become members as part of their proper equipment.

Art Students and Art.

The letter contributed by Mr. W. R. Sickert to the *Times*, deals with the present system under which students of art are allowed to continue their studies regardless of whether there is either the talent or application to justify the prospect of their finding employment when they leave the schools. We have in these columns on several occasions called attention to the injustice of allowing studies to be continued when there is little evidence of vocation, and some restraint should long since have been put on this freedom by elimination, "as in all the other Faculties, within the year, of art students either idle or undisciplined," to quote from Mr. Sickert's letter. Without going into particulars there is evidence that this abuse is very serious, as students are allowed to continue who show no evidence of definite vocation, and this in their own interests should not be the case. We have too many inferior practitioners in the arts, as the result of which standards are lowered, and unemployment results. If it is the case that grants to schools are determined by the numbers of students this inducement to sustain incapacity should be surrendered for a better system.

GENERAL NEWS

EASTER HOLIDAYS.

Owing to the Easter Holidays, next week we publish on Thursday, April 14. The latest time for receiving Editorial copy is Tuesday morning, April 12.

Department of Scientific and Industrial Research.

Mr. Henry Thomas Tizard, C.B., A.F.C, F.R.S., has been appointed by His Majesty the King in Council to be Secretary to the Committee of the Privy Council for Scientific and Industrial Research, on the retirement of Sir H. Frank Heath, K.C.B., from that office on June 1 next.

The Roman Baths at Bath.

The Roman Baths at Bath are about to be scheduled by His Majesty's Office of Works, acting on the recommendation of the Ancient Monuments Board, as a monument of national importance. They will remain under the control of the Corporation of Bath.

Memorial to Mr. Parry Thomas.

The Carmarthen Motor Cycle and Light Car Club are initiating a movement to commemorate the late Mr. J. G. Parry Thomas, who lost his life in an attempt to create a new world's speed record for the flying mile on Pendine sands a short time ago. It is hoped to erect a memorial on the burrows over the spot where the ill-fated racing car is buried.

Mansfield Town Hall Scheme.

It is estimated that the new town hall and municipal offices at Mansfield will cost £80,000. The report, prepared by the Borough Surveyor, has already been before the Town Council, and is to be discussed later. The scheme includes an adequate and modern range of offices for the various Corporation departments which are at present scattered about the borough. Some time ago a site was acquired on the Chesterfield-road.

Architectural Students and Office Experience.

The Liverpool Architectural Society announce that ten students of the Liverpool School of Architecture, who have finished their fourth year in the School, and are required both by the University and the R.I.B.A. to spend six months in architects' offices before proceeding to their fifth-year work, will be free till October 6. Many of them have had previous office experience, some of several years' duration. Those members who have vacancies in their office for one or more are requested to apply to the School of Architecture, Liverpool, for further particulars.

A Spanish-American Exhibition.

A great Spanish-American Exhibition is, we understand, to be opened at Seville next year. Planned on a very large scale, to include a building for each of the Spanish-American republics besides one for Morocco and one for the United States, two art pavilions, a fine university building, a casino, a bull-ring, and almost every form of typically Spanish amusement, it will rival Wembley in size, and, since permanent use is to be made of several of the buildings, should surpass it in architectural solidity and finish. Three of the buildings are already completed, and two more are in course of construction.

Excavations in Athens.

The Greek Ministry of Education has received a letter from Dr. Edward Capps, Greek Professor at Princeton University, who has been collecting funds in the United States for excavations in front of the Acropolis, stating that he has completed the collection of the $500,000 [£100,000] necessary for starting excavations at ancient Agora, and that he will arrive in Athens in June in order to sign the final contract for the start of the work. In addition to this amount, which will be deposited with a bank as a guarantee, Dr. Capps says that the United States School of Archæology in Athens will provide a further $500,000 for excavations within the next two years.

Liverpool Cathedral Fabric.

At the North Wales and Cheshire District Conference of the British Commercial Gas Association, held at Wallasey, Cheshire, Mr. Edwin Upton, treasurer of the Liverpool Gas Company, in reading a paper on "Coal Smoke and its Cure," said that the very serious deterioration of the fabric of our beautiful buildings was wholly attributable to coal smoke. It would, of course, be a very long time before the Liverpool Cathedral reached the stage of some buildings on which there were incrustations 3 in. deep, but already its stateliness was being disfigured by a blackness, particularly noticeable on the Lady Chapel side, and it would not be long, under present conditions, before its blackness would be comparable with that of another fine specimen of noble architecture, St. George's Hall.

The Stones of London.

Mr. J. Allen Howe, in an address at the Royal Institution on "The Stones of London," said that London, situated as it was on a substratum of clay and gravel, from its very beginnings had had to go beyond its borders for stone. So great had been the destruction and reconstruction in London that little of the oldest masonry remained, yet in the fragments of the Roman Wall we had evidence that its builders sought the slopes of Hertfordshire for boulders of hard sarsen stone, the Downs and the Weald of Kent for chalk, ragstone, chert and firestone, while the local flint gravel was freely used then as now. The majority of London buildings were now built or faced with limestone, a material which was readily attacked by the acid-laden town atmosphere, yielding calcium sulphate in the process, which was in itself a cause of further destruction, as the solution soaked into the stone and there crystallised. Under the direction of the Department of Scientific and Industrial Research, strenuous efforts were being made to grapple with the problems of decay and preservation; but the shortest way out of our troubles would be through the purification of the town air, though aid could be given by using stone or other material of greater resistivity in situations where it was required; by employing ornament in very bold masses or in quite low relief; by designing and constructing with scrupulous care to avoid lodgment for damp; and by care in the choice of mortar.

COMPETITION NEWS

New Facades, Manchester.

In this competition, promoted by the directors of the tenth Manchester Building Trades Exhibition, the assessors have made the following awards:—1st (£150), Messrs. J. Stanley Walkden & J. L. Martin, Manchester; 2nd, (£50), Messrs. Cooke & Harrison, London. The competition was for new façades on the north, south and west sides of Albert-square, and on one side of a proposed new Grand-avenue. The assessors were Mr. H. S. Fairhurst, F.R.I.B.A., Professor C. H. Reilly, M.A., F.R.I.B.A., Professor A. C. Dickie, M.A., A.R.I.B.A., Mr. Francis Jones, F.R.I.B.A., and Mr. John Swarbrick, F.R.I.B.A.

Secondary School for Girls, Lytham.

Mr. Arnold Thornely, F.R.I.B.A., the assessor, has selected the following architects to take part in this competition:—Messrs. Adshead, Topham & Adshead, Manchester; Messrs. Marshall & Tweedy, Newcastle-on-Tyne; Mr. S. B. Russell, F.R.I.B.A., Hitchin; Messrs. Wm. & T. R. Milburn, Sunderland; Messrs. Buckland & Haywood, Birmingham; Messrs. Bradshaw, Gass & Hope, Bolton; Mr. James Miller, A.R.I.B.A., Glasgow; Messrs. A. W. S. & K. M. B. Cross, London, W.; Messrs. Rees & Holt, Liverpool; Mr. J. E. Newberry, F.R.I.B.A., Westminster; Mr. Wm. H. Ashford, A.R.I.B.A., Birmingham; Mr. F. Willey, Durham. Premiums of £250, £75, and £50 will be awarded.

EXHIBITION NOTES

It is significant of the lack of understandi to what is essential to the creation of real in pictures that amongst the large nun which make up the shows in two attra galleries just opened, there are very few in which can appeal to anyone with a keen of beauty. What is the influence on the ge public who gravely regard them with se interest? It can hardly be a desirable one there is apparently some demand for pic which the owners of galleries think it we supply, whatever the result on the p education.

We have looked over the exhibitions o Royal Institute of Painters in Water-Co and the Royal Society of British Artists every desire to derive interest and pleasure the exhibits, but we must say the few appealed to us at all were in very small num There are many points of view from w pictures may be regarded—the subject ma the form, the colour, the composition, technique, and so on. Failure in one or of these aspects does not necessarily ma picture a failure, but it is hopeless when al essentials of a good picture are overlooked. course, we find some pictures, like those o president, Sir David Murray, which exhibit trained skill of the real artist. The delig atmosphere and delicate charm to be foun his pictures show that his brush has not lo power. Mr. Terrick Williams has done not better perhaps than his "Shadows." He a genuine accomplishment of what the artis out to do.

There is a fine breadth and freshnes "Willows at Winchelsea," by Geo. Graham. "The Nibble," A. D. MacCormick, is an tive subject, with especially good lines of dec tive composition. There is a fine spacious of effect in William Hoggatt's "Manx H and a vigorous breadth in "A Cloudy Rannoch Moor," by W. Egginton. "Br Holland," by F. Stuart Richardson, is admir and "Spring Delights," by John White, Entrance to the Doone Valley," by J. Schofield, "Steyning Chalk-pit," by G Ackermann, and the "Volga Boat Song," John Hassall, are amongst the noticeable th A fine feeling of peacefulness will be note "The Lake," by Percy Lancaster, and the Cathedral," by Harry Hine, is an effe presentment of the general mass of this wond church. "The Triptych," by Miss De Hammond, has a good decorative effect, w would have had much greater value had Gothic framing of the panels been better.

There are few works at the R.B.A. Gal which call for remark, for anything approa a perfect accomplishment is rare. The decorative panel of still life by H. Davis Ri in the Central Gallery is as fine as anythin has done; it is a wonderful expression of colour. There are two pictures by P. Padwick which, in their austere simpl follow in the traditions of old masters of scape, such as we should like to see mor Leonard Richmond has four subjects which a certain arresting quality, but they do not the best that is in him. The "After Breakf by Solomon J. Solomon, "End of the Day, W. Edward Riley, "Sussex Mills," by J. L johns, "Chartres," by Barry Pittar, "J moor," by Alex. Carruthers Gould, and small drawings may be noted with plea The large picture of "Paolo and Francesca George Drinkwater, finely expresses the c of the human form, but it is hardly the su subject which can give a large degree of plea

Obituary.

News has been received in Aberdeen o death, at Port Adelaide, Australia, of James Henderson Cranna, architect, who born in the Buchan district of Aberdeensh 1855. After an adventurous career he se down in Port Adelaide, where he built u important practice as an architect, and p a leading part in the development of that

The Speaker's House, Government of Northern Ireland, Ulster: Detail of Entrance Front.

MESSRS. RALPH KNOTT & E. STONE COLLINS, FF.R.I.B.A., Architects.

CORRESPONDENCE

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

St. George's Hall and the Proposed Cenotaph.

SIR,—I should like to register my protest against the proposed spoliation of the side of St. George's Hall, Liverpool, which must result if the scheme for the Cenotaph is persisted in.

Some years ago I joined with others in protesting against a monument to King Edward VII which it was then suggested should be erected in front of the main portico. Apparently the promoters have forgotten the first principles of design and wish to indulge in what amounts to an anti-climax. The finest monument or statue that art could produce would be out of place on the proposed site. Surely this is a case calling for the action of the Art Committee of the Royal Institute of British Architects, and for every Society having regard for the preservation of civic amenities. In art the finest quality is restraint, and it is well known that a mantelpiece freed from unnecessary ornaments reveals clarity of mind.

A. E. RICHARDSON.

University College, London.

The Liverpool Cenotaph.

SIR,—Your leading article in *The Builder*, dated March 25, which appears to give the opinion of the large number of architects and citizens of Liverpool, in our opinion opens up a question regarding the competition for this Cenotaph. Paragraph B of the instructions clearly stated "The competitors are to consider carefully the *shape* and *size* of the Cenotaph in relation to that of St. George's Hall." Quite 75 per cent of the competitors who had studied this important condition, submitted designs of a perpendicular nature, which would not have interfered with the view of the Hall, and yet the selected design is one, which, in our opinion, ignores this main condition, and if erected would obliterate from view a large portion of St. George's Hall itself. We are not criticising the design of Professor Budden, which we think a most admirable one, but its suitability to the site.

COMPETITORS.

We take the following letter from the *Liverpool Echo*:—

In a recent issue you have the following: "A Liverpool architect commented strongly on *The Builder's* attitude. *The Builder* is a builders' paper, not an architects'," he said. "It previously had a similar sort of campaign, if one might call it so, after a Manchester competition." Both of these statements are inaccurate. The full title of the journal in question is "The Builder, a Journal for the Architect and Constructor"; and what is more, it is read by practically every architect of standing in the British Isles.

It had not "a similar sort of campaign—after a Manchester competition," or in fact any "campaign" at all. The journal in its critical review, accompanied by excellent illustrations of the selected designs in the Manchester Art Gallery Competition, highly praised the project placed first by the assessors, but also pointed out they considered it had broken the conditions governing the contest.

May I ask "A Liverpool Architect" what sort of "campaign" there is in this, and why the journal should comment at length on an important architectural competition if it is only read by builders?—F.R.I.B.A.

The Registration Bill.

SIR,—I have read the letter from "Interested" in your issue of last week, and after going through it I cannot find out what he and numerous others of his type really want in the way of an Architects' Registration Bill. It is so easy to make destructive criticism of any project of this nature, and most of those who indulge in it fail altogether to put forward any constructive suggestions for amendment.

It is all very well for "Interested" and others to bleat about the way in which they feel auctioneers and others will still be able to practise as architects (though not using the title). Surely he and they must know by now that it would be altogether hopeless to put a Bill before Parliament which would have the effect of preventing any existing practitioner from earning his living as he has hitherto earned it? This point has been drummed in until one is weary of hearing it, but still there appear to be people like "Interested" upon whose understanding it continues to make no impression. It has been said over and over again that this Registration Bill is legislating for future generations of architects. It cannot, in the nature of things, legislate for the present. The longer it is put off, the further distant will be the time when architecture as a whole benefits from it.

I fail entirely to follow "Interested's" contention that the Bill will strengthen the position of an auctioneer. Most of the auctioneers who at present practise as architects call themselves "auctioneer and architect" (or the reverse), and the Bill goes a very long way in putting an absolute stop to that. "Interested" seems to visualise a member of the public going to an auctioneer to design a house, and being gulled by that gentleman into believing that, although he must not call himself an "architect" yet his qualifications to act as such are recognised in an Act of Parliament which allows him to practise as an architect without using that title. I cannot imagine the ordinary member of the public being quite so simple. When the dentists made a hash of their first Registration Bill by protecting only the title of "Dental Surgeon" and not that of "Dentist," a similar bleating was heard; but what intelligent member of the public was there who did not know that if he wanted a qualified man he must look for the proper title of "Dental Surgeon"?

When a member of the public requires the services of an architect he looks for the title "Architect" and is hardly likely to be soft-soaped into going to an auctioneer by any windy explanation from the latter to the effect that he "is really an architect but must not call himself one." In protecting the name "Architect" the Bill goes as far as Parliament is reasonably likely to let any such Bill go, and at any rate far enough to make a very great stride in the interests and for the progress of the profession of architecture as a whole.

PRO RATIONE.

SIR,—Your correspondent who signs himself "Interested" has rather missed the point of my former letter to you. This (former) letter related to a clause which was in the original draft of the Architects' Registration Bill, but which now no longer appears, and which stated that no person other than a Registered Architect could give an "architect's certificate" (to his client). The suggestion was then made that to exempt members of other Institutions from the provisions contained in this clause was to nullify the Bill. My (former) letter was to enquire what difference there was between the certificate given by the architect for a large building to his client for payment to the contractor and the certificate given by an engineer similarly engaged, and to point out that if engineering societies were not exempted from the clause governing the giving of certificates, their members would be prevented to a great extent from performing professional duties.

As, however, this clause no longer appears, the argument over it is rather a waste of paper.

MAURICE G. KIDDY,
Secretary, the Institution of Structural Engineers.

Limited Competitions.

SIR,—One of the most remarkable of post-war professional practice doubtedly the gradual suppression of t architectural competition. Age, in it to curb the ambitions of youth, alway considerable ingenuity and has, in th adopted a benevolent attitude, as wh say, "Enter in competition among yo my little men, for the magnificent that are never going to be erected, for our part, will confine our activitie buildings that are actually to be bui cause of the age limit we cannot en competition with you for castles in You must not enter into competition for buildings that are really going to because you are too young."

It is true that diligent seekers m occasionally an announcement of an op petition. The legend that such th really exist is thereby perpetuated. On gation, however, it will invariably t that such a competition has been ba the R.I.B.A., or that it is limited t tects established in practice within f a half miles of Merthyr Tydvil.

In secret haunts where men of the a tural underworld foregather, it is pered that irresponsible enthusiasts, disguised as private practitioners (c with printed notepaper), once obtained tance to a sacred circle of limited comp But alas! Their names were not amon of the premiated three. And, like t majority of their contemporaries, they doomed to expend their competitive on the elucidation of cross-word puzz it is not permissible to win real archi competitions, there can surely be no br professional etiquette in winning real bladed pocket knives equipped with co attachments and prongs for extractin from the hoofs of horses.

e Royal Gold Medal for Architecture.

Special General Meeting of the R.I.B.A. arch 28. Sir Herbert Baker, A.R.A., B.A., was elected by the members, and me will be submitted to His Majesty the s a fit recipient of the Royal Gold Medal chitecture for the year 1927.

Minutes of Council.

owing are notes from the minutes of the l for March 14 :—

ctural Remains of Early London.—It was to publish a letter from the Librarian urator of the Guildhall Library and n asking for the help of architects in tion with the identification and record- structural remains of early London particularly Roman London), as they ought to light by excavations.

B.A. Examinations Overseas.—On the nendation of the Board of Architectural ion, a definite sum was allotted for the nt of examiners conducting the R.I.B.A. nations in the Dominions.

Surveyors' Institution and the R.I.B.A. f Articles of Pupilage.—Permission was to the Surveyors' Institution for the tion of the R.I.B.A. Form of Articles of e for use by members of the Institution eir pupils.

B.A. Business Meetings.—On the recom- tion of the Practice Standing Committee, ne was approved, providing for informal ions of matters of current professional at general business meetings at the ion of the formal business.

Revised L.C.C. Drainage By-laws.— mments of a Joint Committee of repre- ves of the Practice and Science Standing ttees on the draft revised Drainage s made by the L.C.C. under Section 39 (1) Public Health (London) Act, 1891, with to water closets, &c., were approved mission to the L.C.C. :

wship.—The following were elected s of the R.I.B.A. : J. R. Boyd-Barrett, . S.W. 10 (Special Exemption) ; F. d. Aberdeen (Robert Gordon's Colleges, en) ; Evelyn Freeth, Bristol (Archi- Association) ; R. L. Gehlote, Rajpu- ndia (Bombay School of Art) ; H. H. ith. London, N. 6 (Architectural tion) ; C. Spence, Aberdeen (Robert s Colleges, Aberdeen) ; W. A. Wood, ie, Aberdeenshire (Robert Gordon's . Aberdeen).

nations.—The following resignations were accepted with regret : Sidney Roberts Stevenson, F.R.I.B.A. ; Alfred Robert Brede, A.R.I.B.A. ; Charles Spencer Haywood, A.R.I.B.A. ; Leslie Hagger Kemp, A.R.I.B.A. ; John Savage, L.R.I.B.A.

Retired Fellowship.—Alexander Nelson Hansell, elected Fellow 1891, was transferred to the Retired Fellowship.

Application for Election as Licentiate under Section III (f) of the Supplemental Charter of 1925.—One application was approved.

Maintenance Scholarships in Architecture.

The Maintenance Scholarships Committee announce that they have received a contribution of £5 5s. from the Northamptonshire Association of Architects towards the Maintenance Scholarships Fund.

BERKSHIRE SOCIETY OF ARCHITECTS.

The seventh annual meeting of this society was held at Reading University on March 23. The society has a membership of 101, including honorary members. The prizes awarded by the Berks Archæological Society for measured drawings were presented to Mr. J. W. Turner and Mr. R. P. Walden.

The following officers were elected to serve during 1927 : Chairman, Mr. J. T. Saunders, F.R.I.B.A. Vice-Chairman, Mr. J. G. T. West, F.R.I.B.A. Hon. Librarian, Mr. H. Whiteman Rising, F.R.I.B.A. Hon. Treasurer, Mr. W. R. Morris, F.R.I.B.A. Hon. Auditors, Mr. A. S. Cox, L.R.I.B.A. ; Mr. E. P. Morgan, L.R.I.B.A. Hon. Secretaries, Mr. W. J. Freeman, A.R.I.B.A. ; Mr. E. Steward Smith, A.R.I.B.A. Four Members, Mr. W. Roland Howell, F.R.I.B.A. ; Mr. Harry Hutt, F.R.I.B.A. ; Mr. C. B. Willcocks, R.F.I.B.A. ; Mr. S. E. Burrett. Seven representatives of the Berkshire Society of Architects on the Council of the B.B. & O.A.A. : Mr. W. Roland Howell, F.R.I.B.A. (Reading) ; Mr. Harry Hutt, F.R.I.B.A. (Reading) ; Mr. H. Whiteman Rising, F.R.I.B.A. (Reading) ; Mr. C. B. Willcocks, F.R.I.B.A. (Reading) ; Mr. E. P. Warren, F.R.I.B.A. (Cholsey) ; Mr. J. G. T. West, F.R.I.B.A. (Abingdon) ; Mr. E. Steward Smith, A.R.I.B.A. (Reading).

After the meeting a lecture was given by Mr. Oswald P. Milne, F.R.I.B.A., on "Architecture in Modern Life." The speaker drew attention to the desirability of arousing a public interest in architecture, and establishing a public opinion which would prevent the erection of unsightly buildings, such as at the present time were spoiling the outskirts of our towns. The lecture, which was illustrated with lantern slides, dealt with the conditions of life in England in various periods, and their influence on architecture, and showed how the conditions of to-day are being met by architects in many places with success.

OXFORDSHIRE SOCIETY OF ARCHITECTS.

The annual general meeting of this Society was held on March 25. The following officers were appointed for the ensuing year :

Chairman : Mr. N. W. Harrison, F.R.I.B.A.
Vice-Chairman : Mr. G. T. F. Gardner, F.R.I.B.A.
Secretary : Mr. T. Rayson.
Treasurer : Mr. F. E. Openshaw, A.R.I.B.A.
Executive Committee : The Officers ; and Mr. T. H. W. Dance, L.R.I.B.A.

MEETINGS

Friday, *April* 8.

Royal Sanitary Institute.—Mr. W. R. Hicks on "Scavenging, Disposal of House Refuse." At 6 p.m.

Royal Sanitary Institute.—Discussion on "Liverpool Main Drainage System." To be opened by Mr. H. C. Williams, Assistant City Engineer, Liverpool. At University, Liverpool. 5 p.m.

Joint Delegation of the Local (Yorkshire) Associations of the Institutions of Civil, Mechanical, Electrical, Municipal and County and Locomotive Engineers.—Second Joint Delegation Dinner. At Great Northern Hotel, Leeds. 7 p.m.

Monday, *April* 11.

Royal Institute of British Architects.—Professor Patrick Abercrombie on "The Planning of East Kent." At 8 p.m.

COLOUR IN ARCHITECTURE

In a recent lecture for the University of London at the Central School of Arts and Crafts, Sir Banister Fletcher, V.-P.R.I.B.A., discussed the further development of architectural style which was consequent on the removal of the capital of the Roman Empire by Constantine in A.D. 324 from Rome to the old Greek city of Byzantium, which was renamed Constantinople. This daring change, said the lecturer, was made largely from commercial considerations, and it indicated not only the progressive commerce of those days but also the foresight and enterprise of the first Christian Emperor, which had secured for him the title of "Constantine the Great." Constantine had established Christianity as the State religion in A.D. 323, and it was only in accordance with human nature that differences and disputes should arise, and when, later, the Church was divided, Constantinople took the lead of the eastern division of the Church. A basilican church was there erected by Constantine, and this site was afterwards selected by the great building Emperor, Justinian, for his great church of the "Hagia Sophia," or Divine Wisdom. Roman tradition, Greek talent, and Oriental surroundings combined to develop a curiously clever compound of architectural character which was now known as Byzantine. It was a compromise between the Roman science of construction and the accepted eastern methods of domical building. Certain aspects of eastern Christianity also contributed modifications to the plan, for in the east there was only one altar, in great contrast to the many altars of the Roman Church. The sanctuary was cut off from the rest of the church by a huge iconostasis or painted screen. Here again the east differed from the west ; in the former, which dreaded idolatry, no carved figure was permitted, and so it came about that coloured marbles and glowing mosaics were used to sheath the walls. The one and only altar and a use of a central dome together made a great central space more natural than long-drawn nave and aisles of basilican type. The great new feature was the use of a circular dome brought by means of pendentives in the angles to a square plan, and it was this dome which made the main tendency of Byrantine architecture vertical in effect.

THE AMENITIES OF CHELSEA

A society to protect and foster the amenities of Chelsea was formed at a meeting held recently at Wentworth House, Swan-walk, Chelsea.

Lord Ernle presided over a large gathering of prominent residents in the district, and speeches in support of the society were made by Mr. Augustine Birrell, the Mayor of Chelsea, Sir Albert Gray, Mary Lady Lovelace, and others.

Mr. Reginald Blunt, in an address previous to the formation of the society, said that the experience of the last three months alone sufficed to show that there was need for such a society, for in that time they had had four matters that might well have come within its cognisance—namely, the threatened destruction of Lombard-terrace, the proposed buildings on the Duke of York's ground, the felling of trees in Cheyne-row, and some possible improvements of Royal-avenue ; to say nothing about a curious and interesting communication about the proposed Whistler memorial on Chelsea Embankment. Speeches welcoming the formation of the Chelsea Society were also made by the secretaries of the London Society and of the Society for the Protection of Ancient Buildings.

The following were nominated to form the first council representative of the Chelsea Society :—Sir Albert Gray (chairman), Lord Ernle, Mary Lady Lovelace, Mr. C. H. St. John Hornby, Mr. Aubrey Lawrence, a member representing the Chelsea Arts Club, and Mr. Reginald Blunt.

AMERICAN APARTMENT HOUSES—XIII

By F. E. BENNETT, A.R.I.B.A.

SERVANTS' QUARTERS.

An Entrance Treatment on 47th-street, New York.

THE servants' quarters consist of servants' hall, servants' rooms, bath and w.c. combined, passages. They are separated completely from the other parts of the flat and made to face on the rear and side courts. Normal sizes are: Servants' rooms, 70 or 80 sq. ft.; passage, 3 ft. 4 in. wide; doors, 2 ft. 10 in. wide; windows, 3 ft. to 3 ft. 4 in. wide; bathroom, 2 ft. 6 in. by 5 ft.

The servants' hall is frequently "dark" and no more than an internal lobby. Each servant is given a separate bedroom which contains its own lavatory basin.

Whereas in Europe servants often constitute part of the family, in America they remain quite separate from it. They are largely humble Irish, who must be allowed opportunities of entertaining their friends on the premises. The existence of the service lift, quite separately from the passenger lift, is again a good thing, as it can be used by the servants' guests.

Elevations.

The tall apartment houses about eight stories high, first built in 1890, had the same peculiarities as the speculating builders' work erected in the London suburbs at about that time. Later on the Roman style of the Gorham Store Building on 5th-avenue, while setting the style for commercial buildings, also influenced apartment house design and superseded the influence of the Ecole des Beaux-Arts style, under which a number of tall apartment house and hotel designs had appeared. These had, however, created a high standard of architectural excellence, in which richness of ornament was conspicuous. Under later developments bricks came into fashion again and the general treatment became lighter.

At the present time the fashion is for very simple domestic elevations of a Georgian character, in which bricks, yellow or red, are pleasantly combined with stone. The lower stories are cased with Indiana limestone, and cornices and projections above are kept quite slight. Spots of interest are given by small metal balconies, slightly projecting, and by cartouches in low relief. Breaks in the frontage are avoided. Entrance doorways receive careful attention, and are in most cases very successful (see illustrations).

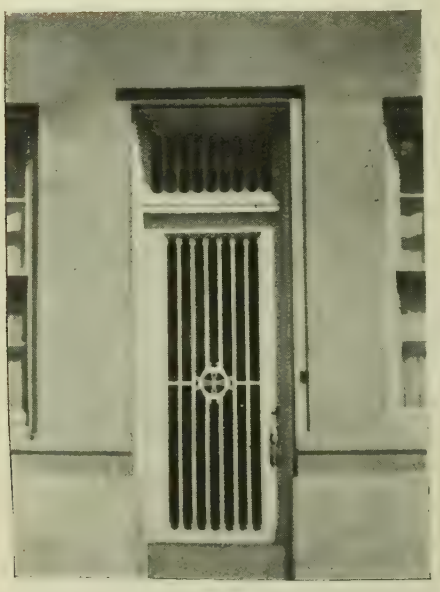
The appearance of most of the older buildings in New York is marred by the ugly water tank, which sticks out exposed above the roof.

The faces of party walls, when they rise high above the adjacent property, are to-day being handled much more carefully than of old. Instead of the plain, monotonous wall surface of all one brick, simple diaper patterns are now worked in different-coloured bricks.

Mr. N. C. Curtis, in his work, "Architectural Composition," says:—

"The composition of the tower-like building . . . where the verticality of the mass is greatly emphasised, depends upon the artistic accentuation of certain conditions of programme, *i.e.*, purpose of building, materials and mode of construction, style of architecture.

"The ordinary floor levels are wholly suppressed in the effort to avoid monotony and to emphasise the verticality of the composition. The design of the roof is another factor which



Entrance to a 15-story Apartment H New York.

is of little importance compared with buil of ordinary height.

"In all tall buildings classically com there results the usual division in vertica portion of base, shaft and capital. The story will be high and monumentally tr with a good entrance, a second story for transition between ground and apart floors, 'all treated alike because they alike.' The top story will be richly tr for the satisfaction of the eye, which den that the edifice be crowned and adeq terminated."

It may be said the possibility of ever m these buildings look really beautiful existing conditions seems small. They great rectangular blocks with little or no position of massing, and a great numb squarish windows, openings taken out of They are ugly to start with, and the mos can be done is to adorn them so that people will find them livable. One arc describes this type of building as a ki

2 in. under the window board and a of the floor area. The windows come almost square." Another says: "The requires too much window to make a good job of the elevations. You must regular Italian windows of the same its, even for the bathrooms, for you can't ignified without."

is the rule to paint the woodwork of ows cream or white colour. Most win- are designed with a central mullion g to the squarish shape which they are d to take up, the ceilings being compara- low. The entrance to a block of flats proached under a long canvas marquise, of semi-circular section, which stretches to the far edge of the pavement, but the doorway is not always well designed so that the marquise abuts on to it properly. Slight projections of the cornices are suitable to the climate. Only 3 ft. is allowed by law. Inner courts are extremely plain and unadorned. usually being faced with light yellow bricks from top to bottom, although these yellow bricks cost as much as facing bricks.

Mr. Stanley C. Ramsey's book, "Late Georgian Houses," has provided inspiration for some of the good façade treatments. A very successful case is the Sheraton Apartment Hotel at Boston.

Mr. Whitney Warren says he thinks the natural character of American architecture lies in verticality. The heavy cornice everywhere is a mistake. He considers that the American Radio Company's Building in New York has the right idea in it. The much-discussed Shelton Hotel, New York, by Mr. Harman, undoubtedly promises some new development for this class of elevation.

Roman Remains in Kent.

Specimens of Roman paving and pottery have been discovered, so it is understood, on the site of the Bromley Rural Council's new offices at Orpington.

Treatment of Lower Floors of 277, Park-avenue, New York.

ILLUSTRATIONS

The Speaker's House, Government of Northern Ireland.

We illustrate this week the official residence of the Speaker to the Northern Irish Parliament, the Right Hon. R. W. Hugh O'Neill, M.P. The building has been erected on a site just outside the city of Belfast, within a short distance of Stormont Castle, the official residence of the Premier, the Right Hon. Viscount Craigavon of Stormont, and close to the new Parliament Buildings.

The chief feature of the plan of the house is the arrangement of the reception rooms on the ground floor which, on the occasion of official functions, can be opened up by means of the sliding doors between each room. The house is faced with multi-coloured bricks made at Buckley Junction, Chester; the entrance porch and drawing-room bay have Portland stone dressings. The roof is covered with tiling of a subdued soft brown-red colour of varying shades.

The main contractors were Messrs. Courtney & Co., of Shaftesbury-avenue, Belfast, who have very sympathetically interpreted the architects' design. The engineering services were designed and supervised by the Chief Engineer to H.M. Office of Works. The carving is by Mr. George Alexander.

Messrs. Ralph Knott and E. Stone Collins, FF.R.I.B.A., were the architects.

The sub-contractors were as follows:—Ames & Finnis, roof tiling; the Carron Company, kitchen ranges; Stevenson & Turner, Belfast, grates; H. H. Martyn & Co., Ltd., Cheltenham, decorative plaster; A. M. Macdougall & Son, Glasgow, oak batten and wood block flooring; Carter & Co., Ltd., of Poole, wall tiling; Henry Hope & Son, Ltd., door furniture; Musgraves (Liverpool), Ltd., Liverpool, sanitary fittings; the Brightside Foundry and Engineering Co., Ltd., Liverpool, heating and hot water installation; James Louden & Co., Belfast, electric light installation; Higgins & Griffiths, electric light fittings; Roneo Ltd., pressed steel doors.

Recent Work at Southport.

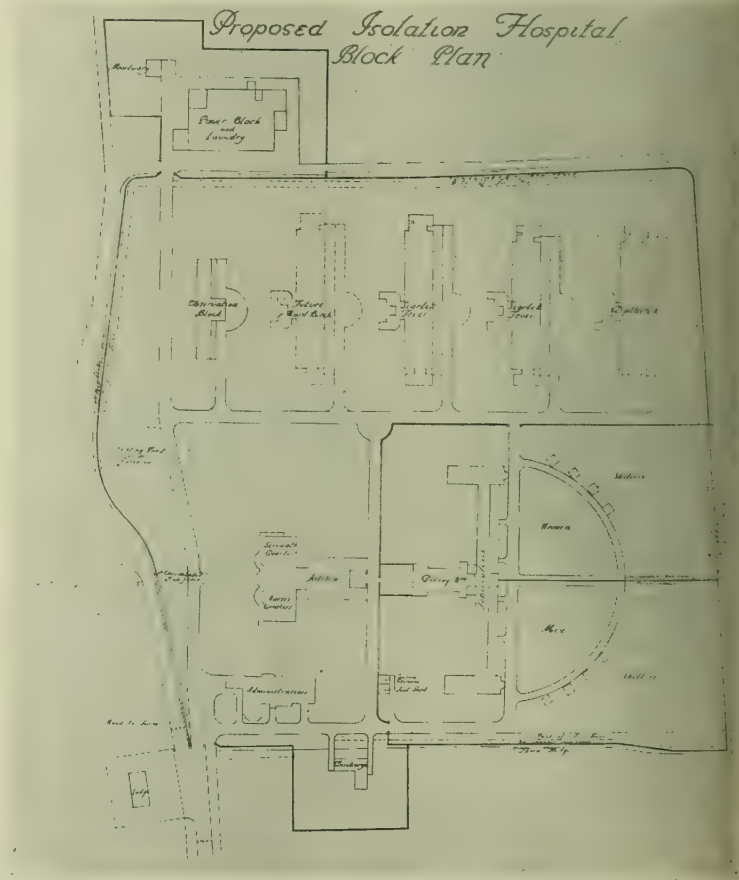
We reproduce in this issue plans and a perspective view of the Southport Bathing Lake now being constructed, together with photographs and plans of some of the other buildings recently erected or in course of erection by the Southport Corporation. These illustrations provide an interesting example of the development of the amenities of an English seaside resort. Following are some detail particulars of each work.

Open-Air Bathing Lake, Prince's Park.

The construction of the new Bathing Lake was begun this year as relief work for the unemployed in the borough. In the design an endeavour has been made to give the effect of a bathing lake in a garden, and to make the whole of the Park visible to persons sitting on the terraces around the lake. The main entrance to the lake will be from the Park, with subsidiary entrances from the Marine Drive. The main buildings of the lake, namely, the dressing box pavilions, the café, and long verandas are placed with their backs to the prevailing winds, and form a semi-circle which will protect spectators sitting on the terraces and bathers in the water. At the end of each veranda is situated a dressing pavilion of two stories, the one on the south being for women and that on the north being for men. These buildings will be constructed of brick with reinforced concrete floors and flat roof. They will be faced externally with multi-ruf bricks and roughcast with purple sand-faced brick dressings. The cornices, strings and architraves are to be Dungeon stone. The upper floors are level with the upper promenade round the lake, and in each case will contain about 120 dressing cubicles constructed of pitch pine. The lower floor will contain lavatory accommodation, additional dressing accommodation for crush days, store rooms, heating chamber, etc. The upper promenade will be 12 ft. wide, laid with cream-tinted artificial flags with patterns of red brick therein. Between the upper promenade and the bathing lake on the westerly side is a terrace containing eight rows of seats. These seats are continued on the easterly side of the lake, but on this side are diminished to three tiers.

The lake is elliptical in shape, having a maximum length of 330 ft. and a maximum width of 212 ft., and will contain 1,400,000 gallons of water. There is a full-size swimming course having a length of 100 metres and a width of 56 ft., approximately in the centre of the lake. The depth of the water at the edge of the lake will be from 9 to 18 in., gradually deepening towards the swimming course. The swimming course will have a minimum depth of 4 ft. 6 in. in the middle, deepening at the ends to 6 ft., with a diving depth of 9 ft. for men and 6 ft. for women in the bays at the ends of the swim course. Diving stages reaching a maxi height of 17 ft. at the men's end and 1 at the women's end will be provided. estimated cost of the work is £60,000. whole of the work is being carried ou direct labour from designs and under superintendence of the Borough Engineer

Shops and Office Building.



This block of buildings (see page 575) been erected in Eastbank-street, Southport a site near to the centre of the town, an the property of the Corporation. It con of four lock-up shops on the ground floor suites of offices over. At the rear of building an extension to the existing Gallery has been carried out, consisting three new galleries. The building is of s framed, fireproof construction through The elevations are faced with Stoke stone, shop fronts being of teak. The general tractors were Messrs. Jonathan Parting Ltd., of Middleton Junction, Manches Steelwork by Messrs. Redpath, Brown & Manchester; windows by Messrs. He Hope & Son, Ltd.; shop fronts by Mr. G. Kiddie, Southport. The cost of the works £19,000.

New Isolation Hospital.

This hospital has accommodation for following beds:—

Diphtheria	1	Pavilion	20 beds

Verandas are also d on the observation and tuberculosis

The general contractors are Messrs. Jonathan Partington, Ltd., Middleton Junction, Manchester, and the cost of the whole works is £76,500, exclusive of furniture.

Municipal Band Enclosure, Lord-street.

The Band Enclosure is situated in Lord-street on a site immediately in front of the Municipal Buildings. It is 334 ft. long and 100 ft. wide, and enclosed with an artificial stone balustrade with grouped columns placed at the entrances from Lord-street. A small café servery in artificial stonework is situated at the north end, the portion of the enclosure at this end being used as an open-air café. The bandstand in the centre of the enclosure is constructed of wood. It is circular on plan, 28 ft. in diameter. It has a domed roof covered with copper, the whole being supported on circular coupled Ionic columns. The floor of the enclosure is laid with black, white and green marble tiles laid to pattern. The enclosure is illuminated by means of ornamental electric standard lamps placed around the balustrade. The artificial stonework was carried out by the Empire Stone Co., Ltd.,

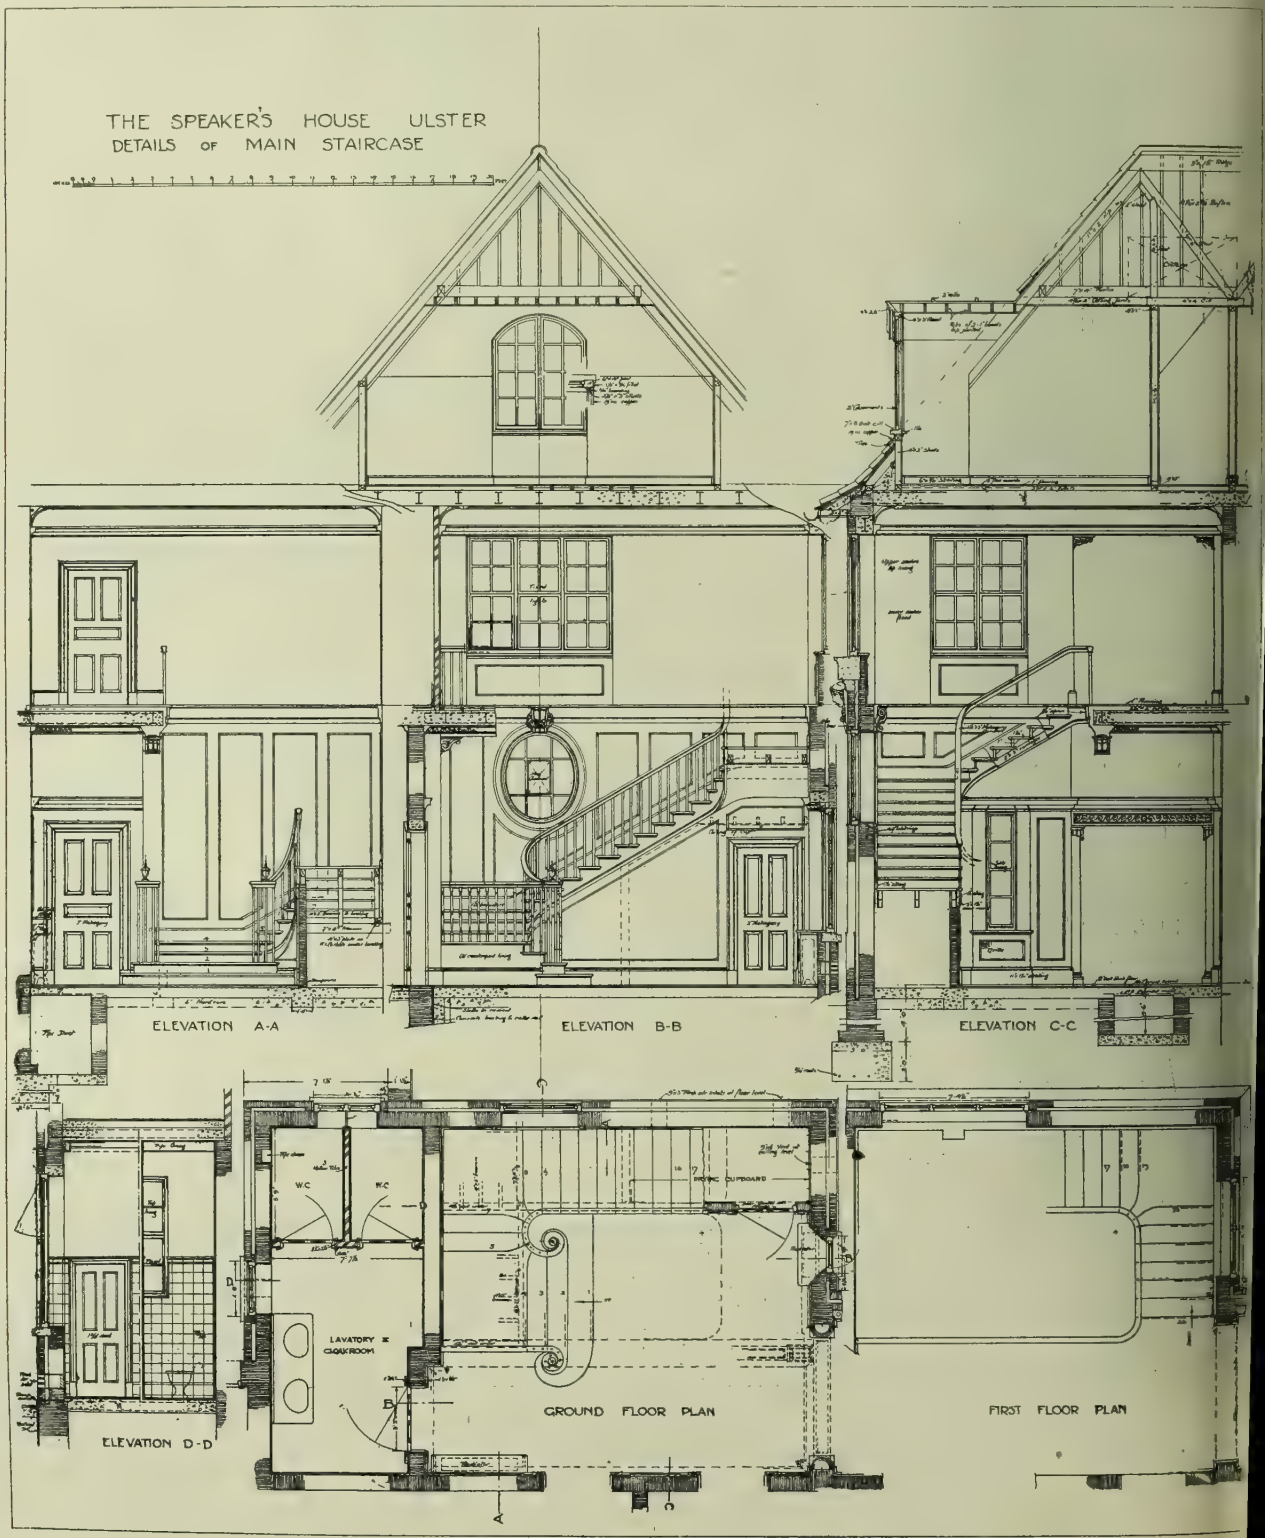
The Speaker's House, Government of Northern Ireland, Ulster.

Messrs. Ralph Knott & E. Stone Collins, FF.R.I.B.A., Architects.

Loughborough. The enclosure has a seating accommodation for 3,000 people.

Victoria Baths Remodelling.

The original structure was built in 1871 and consisted of seven plunge baths in addition to a number of slipper and well baths, etc. The whole of the interior of the building has recently been taken out and remodelled, and the accommodation now comprises the following:—New entrance foyer with offices, etc., first class plunge, boys' special plunge, premier plunge, gentlemen's 1st and 2nd class slipper baths, ladies' 1st and 2nd class slipper baths, Turkish baths, café and kitchen, and all necessary corridors and subways. The whole of the dados and floors of dressing boxes in plunge baths, slipper bath cubicles, corridors, etc., are finished with a terrazzo face. All doors, frames, etc., are in oiled Rangoon teak and the metal work is of Admiralty bronze. A filtration, circulating and heating plant has been installed capable of filtering the whole of the water of the three plunge baths once every six hours. A Permutit water softening plant has also been installed, together with new laundry machinery. The Turkish baths are heated by a Royle's patent air heater, and hot and cold, salt and fresh water are laid on to each slipper bath. The necessary steam is supplied by two Lancashire boilers. The works are now nearing completion and the cost amounts to £43,000. The general contractors are Exors. of D. A. Ablett, of Southport and Wigan.



The whole of the works have been ca out from designs, and under the superin ence, of the Borough Engineer, Mr. A Jackson, M.Inst.C.E., Mr. J. P. Ov L.R.I.B.A., being his chief architec assistant.

Housing Schemes.

Some particulars of the housing sch which have been carried out at Southpor given on page 565.

New Façades, Manchester.

We illustrate this week the first and s premiated designs in this competition, th awards of which are given under Compe News, page 554.

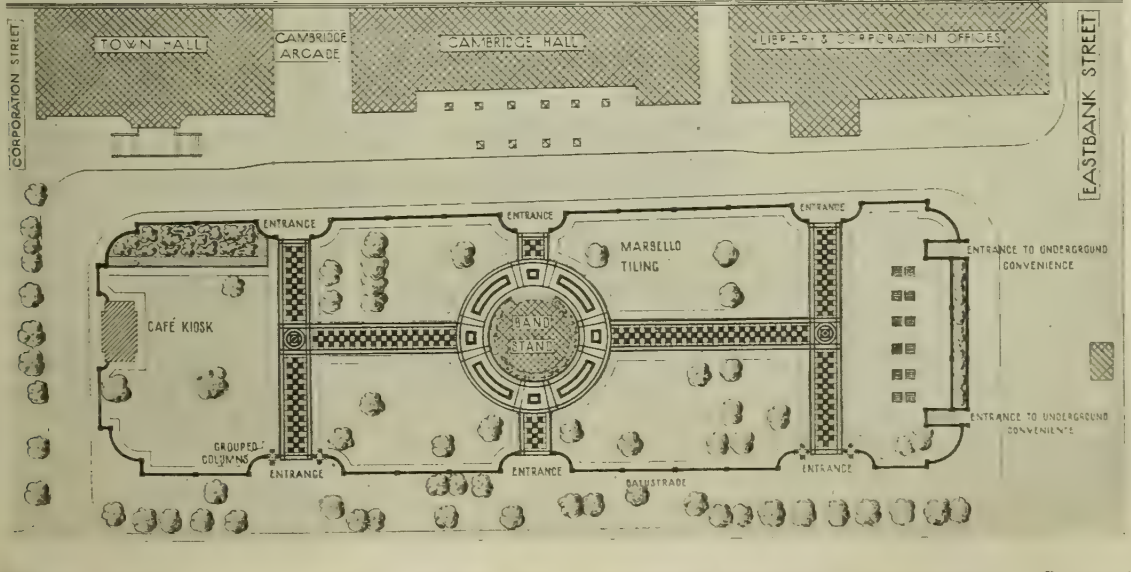
SOUTHPORT HOUSING SCHEMES

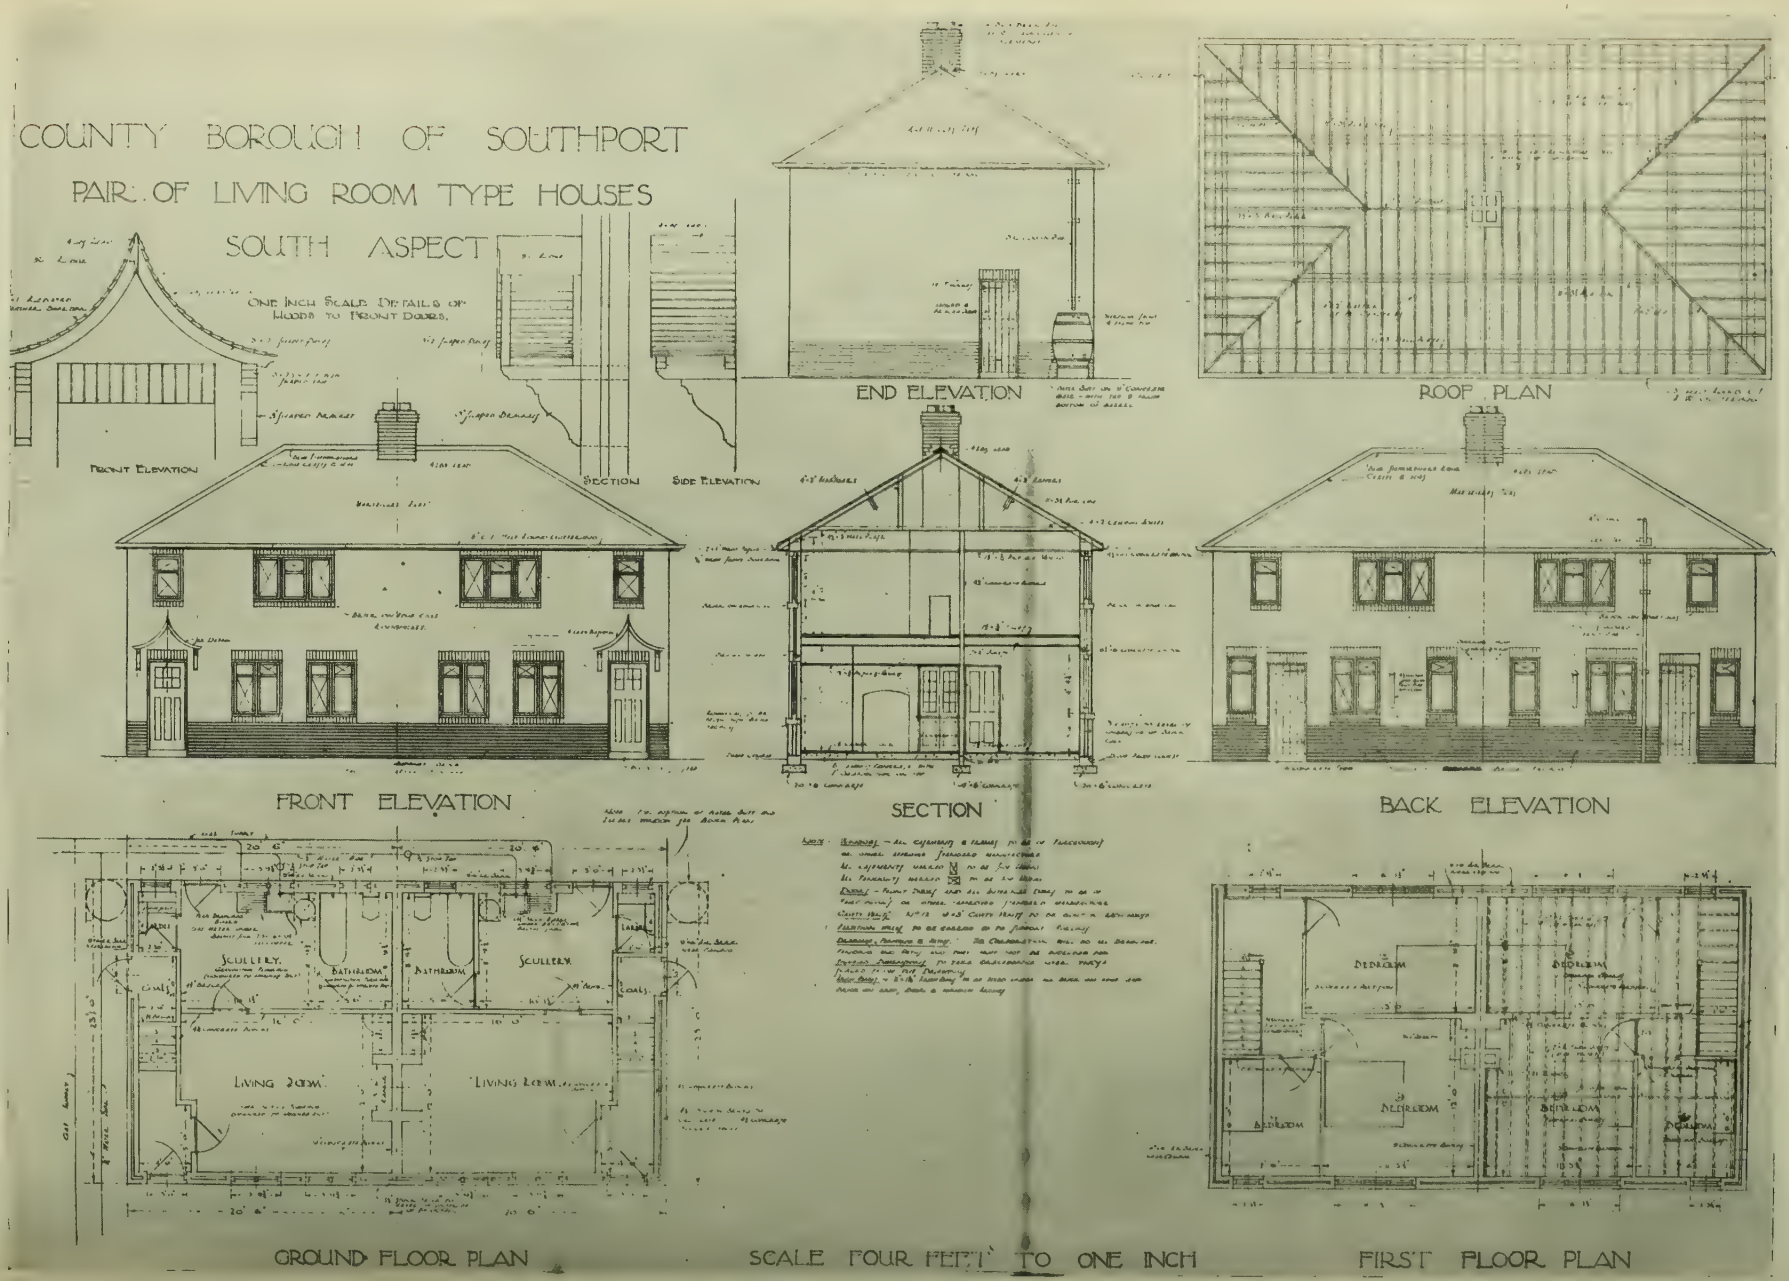
During the last two years the Southport Corporation have let contracts for the erection of 601 houses, consisting of Type A, living room and two bedrooms; Type B, living room and three bedrooms; and Type C, block of four houses consisting of three two bedroom houses as Type A and one small three bedroom house. Following are the contract prices for the different types:—

Type A, £354 10s.
Type B, £433 10s.
Type C, £1,408. Block of four.

These figures include the cost of fencing, paths, gates, drainage, grates, sanitary goods, etc., a p.c. sum of £70 per house being included in the above figures to cover the cost of these items. The houses are constructed of brick throughout with concrete footings. The exterior walls are 11 in. cavity and the interior walls 9 in. and 4½ in. brick. The whole of the interiors are plastered and all woodwork stained. The roofs are covered with Marseilles tiles. The cost of roads and sewers per house varies slightly, but is approximately £65.



The whole of the work has been carried out from designs and under the superintendence of the Borough Engineer, Mr. A. E. Jackson, M.Inst.C.E., Mr. J. P. Owens, assistant. (See illustrations on pages 566 and 567.)



The Bandstand.

Historic Beauty Spot for Chertsey.

Sir William Berry, of Barrow Hills, Long Cross, near Chertsey, is said to have agreed to purchase an extensive portion of the St. Ann's Hill estate, Chertsey, and to be offering it to the Chertsey Urban Council as a gift to the district. St. Ann's Hill, besides being famed as a beauty spot, has historic associations. It was the site of an encampment of ancient Britons, and later was occupied by the Romans. It also formed part of the possessions of Chertsey Abbey. Charles James Fox lived in the house to which St. Ann's Hill belonged for many years after he retired from politics. The property is about 24 acres in extent.

THE RELATION OF BUILDING TO HISTORY

In the course of a lecture on this subject, delivered at Norwich, on March 30, to the Norfolk and Norwich Archæological Society, Mr. F. R. Hiorns, F.R.I.B.A., representing the Society for the Protection of Ancient Buildings, said that to many of us nothing appealed more generally in the life of the past than that which related to Greece and Rome in the Classical Age. Of the former, for example, we constantly conjured up a mental picture of the Acropolis at Athens as embodying in a visual way what we meant by Greek culture. Athens, as an expression of what was meant by the highest aspect of poetic and artistic genius, had become proverbial—even as the age of Pericles had been described as the brightest page in the history of the ideal development of mankind. Plutarch recorded that the chief delight of the Athenians and the wonder of strangers was the magnificence of their temples and public edifices. The Parthenon, indeed, was said to have cost the enormous sum of 1,000 talents. Even in the condition to which the once magnificent Acropolis at Athens was now reduced—with the Parthenon, Erectheum, Theseum, Propylæa, and so on, no more than a series of ruins—he claimed that the history and character of the time and people so represented was put before us in a way that otherwise we should have had no conception of. In Athens, therefore, we had an object lesson of the value of buildings in relation to the appreciation of history. From its ancient and ruined Acropolis we gathered a sufficient impression of former glories that, obviously, furnished the exact setting needed to complete the effect of an oration by Pericles or Demosthenes or a play of Sophocles or Euripides; it was the story of 24 centuries ago expressed in stone and brought before us in a manner that nothing else could make us realise so well. And there was much else that was old in Athens—as in other parts of Greece—relics of their Roman conquerors and many small but remarkable Byzantine churches. But what it was possible to say of Athens might, with almost equal ease and suitability, be said of, and illustrated by, other towns of Greece and her colonies of which remains existed.

What applied to Attica could be similarly said of Rome, though the character of the peoples so represented was vastly different and its expression in terms of building correspondingly varied. The culture and art of Rome were, to a large extent, borrowed from Greece and were combined with a fancy for display of an ostentatious and somewhat vulgar kind that in Athens would have been impossible. Neither the buildings of Rome nor the sculpture and painting embodied in them ever attained the refinement and perfection of Greek work—though largely produced through the agency of Greek workmen; they were always tainted by haste, artificiality and a tendency to ornamental excess. But, leaving this aside, the power and originality of the Romans were strongly displayed in their architecture, and provided us with the most impressive and effective record to be obtained of a great people two thousand and more years ago. Without their buildings we should have lacked a proper understanding of the qualities whereby that people thrust themselves so definitely upon the face of history. Their temples, basilicas, theatres, palaces, bridges, aqueducts, triumphal arches and tombs were sufficiently shown in their ruined state to-day —as in the Forum, the Coliseum, the ruined Baths of Caracalla, the simple and noble Pantheon, the Trajan Column, and so on—which so well displayed their greatness and gave the best possible insight into the mind and character of a people whose Empire once extended from Baalbec in Syria to Africa, Spain and Britain. That this world mastership was still so well expressed in what remained of their buildings was the more remarkable when we realised the fearful destruction that the city of Rome had suffered, both during and since the Empire. Apart from what it endured from wars, flood and fire, it was, for over a thousand years, a pilfering ground for successive rulers or invaders; so that Gibbon (in his "Decline and Fall") deplored that the barbarian conquerors of Rome usurped in a moment the toil and treasure of successive ages—that whatever had escaped Goth and Vandal was pillaged by Greek tyrants; while the Emperor Constans, in his rapacious visit, stripped the bronze tiles from the roof of the Pantheon; that the edifices of Rome were considered a vast and various mine; the first labour of extracting the materials was performed, the metals purified and cast, the marbles hewn out and polished, and after foreign and domestic rapine had been satiated, the remains of the city, could a purchaser have been found, were still venal; and, he adds, the Romans would demolish with their own hands arches and walls if the hope of profit could surpass the cost of labour and exportation, till eventually the fairest columns of the Ionic and Corinthian Orders, the richest columns of Paros and Numidia were degraded, perhaps, to the support of a convent or stable. Even the Popes were little better, and the stones of St. Peter's were largely taken from ancient buildings subjected to such vandalistic destruction, and the baldachino of its high altar fashioned of bronze stripped from the dome of Hadrian's Pantheon. It was worth while contemplating this aspect of the relation of buildings to history if we were to realise the loss which the world had suffered from vandalistic destruction, and how much more easily past times and manners might have been comprehended had such records been more generally preserved. The forces of nature were often kinder to buildings than those of man; Pompeii—overwhelmed and buried in the ashes of Vesuvius in the first century after Christ, and thereby being the best preserved of all ancient towns—was an example.

The next great historical style or mode of building to which reference should be made was that known as Early Christian—a phase of architecture which spanned, as it were, between the declining Roman Empire and the early Middle Ages. Churches dedicated to our faith were then modelled in their form upon the classical Roman basilica—the aisles divided from the nave by columns—the roofs of wood, and low-pitched—and marble floors and mosaic and other colour decorations were outstanding features. St. Paul's, outside the walls of Rome, was a typical early example (fourth century), while others, in addition to old St. Peter's, were St. Maria Maggiore, St. Lorenzo, and St. Clemente, until we reached Torcetto Cathedral (seventh to ninth centuries), and St. Appollinare Nuova at Ravenna, of considerably later date (tenth century), showing the supreme splendour of the mosaic figure decorations that attained almost to perfection in this and other Ravenese buildings. This expression of building merged into the greater and more original and varied Romanesque phase—from the Byzantine, that indicated so clearly the distinction between the Eastern and Western divisions of Roman government that commenced in the fourth century, to the French and English varieties, of which the latter was known as Norman—familiar in the wonderful cathedral of Norwich—having between them characteristic Italian development known as Lombardic. Several splendid examples of the last-named manner were to be found in Milan (St. Ambrogio), Verona (St. Zeno and the cathedral), and in Pavia and Piacenza. The sculptured decorations in this work were often of quite extraordinary excellence. But the six or seven centuries of Romanesque Art had brought church buildings much nearer to the form of plan that we now associated with Gothic cathedrals—had seen great developments in round-arch vaulting, and had introduced the dome and spire and much splendid work in tower design. The dome and tower of this period were well shown in the cathedral group of buildings at Pisa. Our own country could show much fine Romanesque or Norman work, and Professor Lethaby recorded that between 1066 and 1150 England was in advance of any other country for church building. It was the essential structural limitations of a round-arch style that caused the pointed arch to be evolved in or about the twelfth century, and introduced the Gothic art that represented the glory of the building guilds of the later Middle Ages.

The Gothic style developed much earlier in the rest of Western Europe than in England but it would make for simplicity if they considered, briefly, only the English phase and the styles that immediately preceded and followed it. In this way the twelfth century could be considered to represent Norman (or late expression of Romanesque); the thirteenth century, Early English Gothic; fourteenth century, Decorated Gothic; fifteenth and early sixteenth centuries, Perpendicular Gothic; and the sixteenth century the transitional style again veering towards the classical, known as Tudor. In the Early English we had great height and narrow spearhead pointed windows and vaults, and the maximum depth of buttresses, as at Salisbury, for example; in Decorated, increased proportions, width and rich but severely geometric tracery and vaulting, as at Lincoln; in Perpendicular a further depression of vaulting and arches, buttresses much reduced in projection, very rich and beautiful vaulting as in Norwich Cathedral roof, King's College Chapel, Cambridge, and Henry VII's Chapel at Westminster, and a general tendency to over-elaboration and decadence. Embattled parapets, roofs almost flat, and square-pinnacled towers were a sign of this style.

But even the very wonderful Gothic architecture was, in due course, subject to change. In the age of Dante, Petrarch and Boccaccio interest in classical literature and art was revived in Italy, and led to the development in the life of Europe known as the Renaissance. Ancient Rome then, in a sense, came into her own again, for with study of the writings of antiquity was coupled the desire to study the material remains of the Eternal City. Scholars and artists of the period were quite naturally attracted thereto, and in and around its ruined structures sought the spirit and inspiration of the Golden Age. In this way, for example, Donatello the sculptor and Brunelleschi the architect (who placed the dome upon the cathedral at Florence) went together to Rome in about the year 1400 and —as Vasari recorded—examined and made careful drawings of the vaults and arches of antiquity, set labourers to work to dig out more remains, and, while there, hardly ceased from recording in drawings all the ruins and fragments of antiquity they could find. Such studies became, indeed, the recognised employment of artists and scholars in the fifteenth and sixteenth centuries, and it was accordingly not surprising that throughout Italy and Western Europe was introduced a great vogue of building—with its accessories of painting and sculpture—that, in broad effect, represented a return to the classic manner, with modifications to meet the altered ideas and essential needs of modern times. In such a way was Renaissance art evolved. It could be said to represent a more cultivated outlook on affairs than was shown in the cruder manners and ideas associated with Mediævalism and the Gothic invaders. The early Renaissance palaces (fifteenth century) of Florence—which the Strozzi and Riccardi were typical—showed both the classic basis of their architectural treatment as well as, by their fortress-like character, the turbulent times in which they were built. Such works as the Library at Venice, by Sansovino, the so-called Basilica at Vicenza, by Palladio, and St. Peter's at Rome (by many architects from Bramante to Maderno) were of the sixteenth century. In this and the century following came also the great Renaissance works in France, of which the Louvre, Fontainebleau, Sorbonne Church, Luxembourg and Versailles

e and les Invalides might be men-
l. In the sixteenth century we in
nd were only beginning to feel the in-
es that were to lead away from our
d architecture in the classic direction
n Italy had already reached maturity—
ork we called Tudor (such as Wolsey's
n of Hampton Court) in the earlier part
it century and the Elizabethan in the
half—as with Kirby House, Burghley
Knole. Then with the seventeenth cen-
ame Inigo Jones and Christopher Wren,
with them the refined, mature, revived
:, and much work by Wren's pupils and
ers in the early eighteenth century.
there was the early nineteenth-century
of John Rennie, an engineer of the old
. not to be distinguished from architects
uilders in the composite sense in which,
that time, constructors of buildings
happily combined. And there was also
uite distinctive Regency architecture,
ented by old Regent-street, London,
ad now practically all gone.
gland had been, and still was, unusually
n old and beautiful buildings—with cot-
barns, and country houses not among
ast of them. In all of these we should
great pride. We ought, indeed, to value
more and not less when we saw what
st half-century or so had brought forth
e desecration of towns and cities, and
was even worse, our scenes of natural
y. For there could be no doubt as to
rtificiality and the excessive and un-
al ornamentation of buildings during
st century—with, in so many instances,
most complete disregard for fitness in
on to both purpose and environment—
senting a great falling away from the
ards set by previous ages. For such
tructures as remained to us, with their
simplicity, practical and decorative fit-
and consequent natural harmony,
ed to a more orderly and sensible treat-
than, for our sins, we had recently
n.
had been well said that history, whether
cal or artistic, was one unbroken tale.
s also said, by Victor Hugo, that archi-
re was the handwriting of the human
in other words, that it was the most
descriptive record of history. That was
r a stupifying thought when we looked
d on our town developments of the last
r 70 years with the destruction of so
good things on the one hand and evolu-
of so much that was unworthy or bad on
ther.
responding to a vote of thanks, Mr.
is emphasised the value of public opinion
pport of the preservation of old buildings
wns, which—as in the case of Norwich—
interest and real value to an ancient
He also paid tribute to the work and
nce of Dr. Stevens Popé, a former Lord
r and chairman of the city's Ancient
lings Committee, and Mr. Walter Rudd,

dation stone of which was laid last Thursday
, will be incorporated three blocks of
land stone carved in St. Paul's Quarry for
Christopher Wren. A feature of the Hall
be frescoes depicting scenes relating to
in Hood, the work of Mr. Denholm Davis.

THE LONDON BUILDING ACTS AND THEIR APPLICATION.—XIII

By H. V. MILNES EMERSON, A.R.I.B.A.

Note.—Walls to public buildings are usually of the thickness, etc., required for buildings of the warehouse class, subject to any reasonable requirement of the District Surveyor concerned. (See Section 78.)

Section 54. (1) Recesses and openings may be made in external wall, provided—

(*a*) That the backs of such recesses are not of less thickness than 8½ in.; and

(*b*) That the area of such recesses and openings above the ground storey do not taken together exceed one-half of the whole area of the wall above the ground storey in which they are made.

Note.—The ground floor and basement are not taken into account as regards openings, thus providing for shop fronts, etc. Above the ground storey the total area of window openings, or window openings and recesses, must not exceed one-half of the whole area of the wall, such wall including gables, pediments, etc.

(2) Recesses in party walls.
(3) Openings in party walls.

Note.—Parts 2 and 3 deal with recesses and openings in party walls. Sections 58, 59, 60, and 77 also deal with party walls. (See recent articles in *The Builder* on party walls by Mr. J. D. Scott.)

Section 55.—All woodwork fixed in any external wall except bressummers and storey posts under the same and frames of doors and windows of shops on the ground storey of any building shall be set back 4 in. at least from the external face of such wall. But loophole frames and frames of doors and windows may be fixed flush with the face of any external wall.

Provided that it shall be lawful for the Council by by-law or otherwise to exempt from the provisions of this section oak teak or other wood provided the work be constructed to the satisfaction of the District Surveyor.

Note.—The new Tudor premises of Messrs. Liberty & Co., Ltd., Marlborough-street, is an example of the use of timber in external walls, exempted from the provisions of the foregoing section by the Council.

Section 56.—This deals with the bearing of bressummers upon walls. When bearing upon a party wall the ends of wood bressummers shall not be placed nearer to the centre line of the party wall than 4 in.

When the bressummer is of metal a space must be left at the end equal to ¼ in. for every 10 ft., or part, for expansion.

All ends of wood joists or beams resting upon a party wall must be at least 4 in. distant from the centre line of the party walls, and no bond timber or wall plate must be built into a party wall.

Note.—Wood not being allowed, a metal wall plate can be used if required under the ends of joists resting upon a party wall.

Wood plates can be used against a party wall to receive the ends of wood joists, etc., provided such plate is supported by corbels of brick, stone, iron, etc.

Section 57.—If any gutter any part of which is formed of combustible materials adjoin an external wall such wall shall be carried up so as to form a parapet one foot at the least above the highest part of the gutter and the thickness of the parapet so carried up shall be at least 8½ in. throughout.

Note.—Excepting to dwelling-houses all projecting eaves must be of fireproof materials (Section 73.)

Section 58.—Cases in which a wall to be deemed a party wall. (See note *re* party walls to Section 56.)

Section 59.—Height of party walls above roof.

(1) Every party wall shall be carried up of a thickness in a building of the warehouse class equal to the thickness of such wall in the topmost storey and in any other building of 8½ in. above the roof flat or gutter of the highest building adjoining thereto to such a height as will give a distance in a building of the warehouse class exceeding 30 ft. in height of at least 3 ft. and in any other building of 15 in. measured at right angles to the slope of the roof or 15 in. above the highest part of any flat or gutter as the case may be.

(2) Every party wall shall be carried up of the thickness aforesaid above any turret dormer lantern light or other erection of combustible materials fixed upon the roof or flat of any building within four feet from such party wall and shall extend at the least 12 in. higher and wider on each side than such erection and every party wall shall be carried up above any part of any roof opposite thereto and within 4 ft. therefrom.

Note.—Although subsection 1 provides that the party wall must be carried 3 ft. above the roof of a building of the warehouse class exceeding 30 ft. high, it can be read that when covered with a flat the parapet need only be 15 in. high.

Upon application to the Council permission can be obtained to omit carrying the party walls above the roofs of dwelling houses, provided such houses do not exceed eight in a block. Where more than eight houses are erected in one block the party wall of every eighth house (or a lesser number if desired) must be carried above the roof as prescribed by the Act. Thus in a block of 10 houses the centre party wall can be carried up having five houses on each side of same or it can be carried up at the eighth house, having eight on one side and two on the other side.

It should be noted that dormers, turrets, etc., placed on roofs or flats within 4 ft. of the party wall entails raising and lengthening such portion of the party wall opposite such projection to a height of at least 12 in above and 12 in. longer on each side, unless such dormer, turret, etc., is constructed of incombustible material.

Section 60.—Rules as to chases in party walls. (See note *re* party walls, Section 56.)

Section 61.—(1) The flat gutter and roof of every building and every turret dormer lantern skylight or other erection placed on the flat or roof thereof shall be externally covered with slates tiles metal or other incombustible materials except wooden cornices and bargeboards to dormers not exceeding 12 in. in depth and the doors door frames windows and window frames of such dormers turrets lantern-lights sky-lights or other erections.

(2) This subsection of the 1894 Act has been repealed and section 12 of the London Building (Amendment) Act, 1905, as follows:—

Means of Access to Roofs.

(1) (*a*) Every existing building to which the section of this Act whereof the marginal note is "projecting shops" applies and every other existing building except a dwelling-house occupied as such by not more than two families, and

(*b*) Every new building shall if having more than two storeys above the ground storey or if exceeding 30 ft. in height be provided (unless and except so far as the Council otherwise allow) by the owner with either

(*a*) A dormer window or a door opening in a suitable position approved by the District Surveyor on to the roof with proper access thereto; or

(*b*) A trap door in a suitable position approved by the District Surveyor covered with copper or zinc and hung on hinges so as to admit of the same opening to the fullest extent and furnished with a counterweight so as to ensure that the same shall

open automatically when unfastened and also with a fixed or hinged step-ladder leading to the roof; or

(*c*) Other proper means of access to the roof and with a sufficient parapet or guard rail where reasonably practicable and necessary to prevent persons slipping off the roof. Any dormer window or trap door provided under this subsection shall only be fastened in such a manner as to ensure access to the roof being always readily available from the inside of the building.

(3) This provides that the slope of the roof of a warehouse class building shall not exceed 47 degrees.

(4) The slope of roofs to other buildings shall not exceed 75 degrees.

Towers, turrets or spires are exempted in both (3) and (4).

Section 62.—Stories in roofs.

(1) Not more than two storeys shall be constructed in the roof of any domestic building.

(2) Any storey constructed in the roof of any domestic building the upper surface of the floor of which storey is at a height of above 60 ft. from the street level shall be constructed of fire-resisting materials throughout.

Note.—An hotel exceeding 250,000 cubic ft. would be a public building and not a domestic building.

THE WEEK IN PARLIAMENT

WESTMINSTER, *Wednesday.*

Scottish Housing.

Sir J. Gilmour informed Dr. Shiels that the numbers of houses built by local authorities in Scotland under each of the post-war State-assisted housing schemes as at February 28, 1927, were as follows:—

Housing, Town Planning, &c. (Scotland) Act, 1919	25,528
Housing, &c., Act, 1923 (including Slum Clearance Schemes)	7,861
Housing (Financial Provisions) Act, 1924	5,932
Demonstration Houses	17
	39,338

Leasehold Reform.

THE Landlord and Tenant Bill, which embodies the Government's proposals for Leasehold Reform, has been introduced and read a first time.

Restoration of Parliament Buildings.

On a Vote to complete the sum of £86,610 for expenditure in respect of Houses of Parliament buildings,

Captain King, speaking for the First Commissioner of Works, having described the decay which had occurred, said an expert Committee had been appointed by the Department of Scientific and Industrial Research with the idea of finding some method of preserving the stonework. Failing any efficient method of preservation, it became necessary to resort to hand-picking to remove those loose fragments of stone which were a danger to the rest of the building and to passers-by. In recent years no less than £37,000 had been expended in merely removing unsafe fragments of stone. It was not really economical to continue that method. The removal of the stone did not help to preserve the building. It was only for the purposes of safety, and it had, therefore, been decided that it was necessary to undertake more complete steps for the restoration of the building. The Government had taken expert advice in various quarters, including Mr. J. Allen Howe, Assistant Director of the Geological Society, and Sir Robert Robertson, the chief Government chemist. It was now proposed that the repairs should be carried out with Stancliffe stone. This had been selected as a hard-wearing stone, suitable for the purposes required. The total cost of the restoration would be £1,062,000, to be expended over a period of some 12 to 15 years. Included in the estimate was a sum of £5 for hand-picking. The method of hand-picking would, of course, have to be continued while the restoration took place, but as the restoration neared completion, hand-picking would be reduced.

Mr. Gardner, the Labour member for North Hammersmith, moved to reduce the vote by £100. He said that the Palace of Westminster was the greatest building of its kind in the world, and it was of the utmost importance that its preservation should be undertaken in a proper way. The Government had not consulted the R.I.B.A., the builders of the country, and the workers who would have to carry out the restoration. They had again gone on the basis of chemical, geological, and laboratory tests. He suggested that the entire building should be refaced with whatever stone might be used. If the Government introduced Stancliffe stone into London they would raise a maximum amount of opposition on the part of the workers who were called upon to use it. Portland stone was proving its durability, and was ousting sandstone even in the sandstone districts.

Lord Hartington declared that Stancliffe stone was warm and rich in colour, and its durability was beyond reproach. A large number of buildings in Manchester, Liverpool, and other towns in the North were built of it, as it was found to resist climatic conditions better than any other stone.

Sir Wm. Bull said that Portland stone would be found very difficult to work in the detailed carving that was essential. The Government had come to a wise conclusion in recommending Stancliffe stone.

Mr. Viant thought they ought not to be so much concerned with the colour as with the durability of the stone. The Office of Works would be well advised to consider the death-rate among operatives of the Stancliffe stone before embarking on the scheme.

Captain King, in reply, said that every precaution would be taken and the Office of Works did not think that any injurious effect would be caused to the workmen who used Stancliffe stone. The First Commissioner was working in close touch with the Fine Arts Commission. There were many quite inaccessible and invisible places where the stone was worked in very intricate detail, and the Fine Arts Commission was being consulted to see whether detail in those high elevations could be modified, and if so, in what form.

The motion for the reduction was then negatived, and the Vote was agreed to without a division.

Slum Schemes Approved.

Mr. Chamberlain informed Mr. Lawson that, since 1919, 93 slum schemes relating to 71 local authorities had been approved by his Department. The number of houses and other buildings included in these schemes was approximately 12,000. On March 1, 1927, 245 houses were in course of erection in connection with schemes under the Housing, Town Planning, &c., Act, 1919, and 69 had not been commenced. The boroughs in which no houses had been provided under any of the post-war Housing Acts were Beaumaris, Cowbridge, and Montgomery. None of those were County Boroughs.

Scottish Results.

Sir J. Gilmour informed Mr. Stephen that at February 28, 1927, the latest date for which figures were available, the numbers of houses built in Scotland under the 1923 and 1924 Housing Acts were 16,933 and 6,161 respectively; and the corresponding numbers under construction were 5,829 and 14,084.

The Reduction of the Subsidy.

Mr. Chamberlain, in reply to Col. England, said he had no evidence to show that the reduction in the building subsidy for houses completed after September 30 next had had any prejudicial effect on the rate of building.

A Hereford Case.

Mr. Mardy Jones asked the Minister of Health whether his attention had been called to the fact that the Hereford rural council had no scheme for granting subsidy for the building of new houses; whether he was aware that they had refused a subsidy on a bung built in their area on the ground they had no scheme for subsidy; whether, in such circumstances, he w grant a subsidy

Mr. Chamberlain said that the answer to first two parts of the question was in the a mative. As regarded the third part he not satisfied that sufficient reason existed certifying the local authority to be in def under Section 9 of the Housing (Financial visions) Act, 1924; and in those circumsta he was precluded from making a grant of sub as suggested.

Post-War Housing.

Mr. Chamberlain gave, in answer to Montague, the following statement showing numbers of houses erected in England and W since January 1, 1919:—

	Houses erected by Local Authorities.		Houses erected by Private Enterp
1. *State-assisted houses (to March 1, 1927).*			
(*a*) Housing, Town-planning, &c., Act, 1919	169,805	..	4,54
(*b*) Housing (Additional Powers) Act, 1919	—	..	39,18
(*c*) Housing, &c., Act, 1923	47,859	..	185,37
(*d*) Housing (Financial Provisions) Act, 1924	82,553	..	1,51
Total State-assisted houses	300,217	..	230,62
2. *Non-subsidy houses (to September 30, 1926).*			
(*a*)*Not exceeding £26 rateable value	—	..	207,70
(*b*)*Exceeding £26 rateable value, but not exceeding £78	—	..	80,50
Total non-subsidy houses	—	..	288,20

*The corresponding rateable values in Metropolis were £35 and £105.

The Rents Act.

Mr. Gibbins asked the Minister of Hea whether, before coming to a decision about new proposals concerning the Rent Rest tion Act, it was his intention to consult local authorities.

Sir K. Wood said that before coming t decision all aspects of the question would very carefully considered in the light of many representations which had been recei by the Government. Local authorities other bodies would be consulted if necessa but the time had not yet arrived when s a course need be considered.

Rural Housing.

Sir K. Wood informed Mr. Hurd that Rural District Councils had made applicati under Section 5 of the Housing (Ru Workers) Act, 1926, to be declared l authorities for the purposes of the Act. Th applications would be considered in conju tion with the schemes proposed by the Cou Councils, and the Minister hoped to give decision shortly.

A London Square.

Mr. Cadogan asked the Minister of Hea whether he was aware that it was propo to erect garages in Prince's-square, Kenni ton; and whether he could take any steps preserve this open space, situated in an ov crowded quarter of south-east London, for enjoyment and recreation of the public.

Sir K. Wood said that the Minister had information as to any proposed building this square and no power to prevent it. would, however, bring the question to notice of the London County Council, who, understood, were considering the gene question of London squares.

RCHITECTS' & BUILDERS' INQUIRY BUREAU

are glad to give questions and answers, but cannot t responsibility for contributed replies, especially on matters.

y we appeal to our correspondents to submit their es on paper of a size easily filed, and written as y as possible, or, better still, in typewriting!—ED.

Right of Light, &c.

IR,—The back of a bungalow belonging A overlooks land of adjoining owner, B. building is a conversion of a brick-built mer-house into a bungalow by an addition. old portion has been built for over twenty rs, and the window at the back has existed that time. Now the addition has been le and three more windows overlook the e land, the owner B raises the question of t of light and wants A to enter into an ement to pay a nominal annual sum for light.

uery (1) Can B ask for this, as A has a right ight to the old existing window, by virtue ts age, and these new windows are in the e vertical plane?

uery (2) The windows at back of basement new extension is a casement, opening out. boundary of A's property is about 9 in. y from his back wall, and the casement, n swung open, overhangs slightly B's land. bjects to this. Can he uphold such a or objection?

CROWN GLASS.

A right of light must always be acquired in pect of a building; and when the access and of light to any dwelling-house, workshop or er building has been actually enjoyed for the period of twenty years without interruption, right thereto under the Prescription Act, 2, is deemed absolute. There is, therefore, ght of light in respect to the one window at back of the brick-built summer-house, which aid to have been built for over twenty years, l which has now been converted into a ngalow by an addition. That is, of course, uming that there has been no interruption of light referred to during those twenty years. " is entitled to all the light to this window is necessary and fit for the purposes of occu-ion, or business, according to the ordinary uirements of mankind, and "B" must not use his land to obstruct in any way that right the one window.

But "A" has no similar right of light in pect to the three windows in the new addition rlooking "B's" land; and "B" may build on, or otherwise utilise his land, quite regard-s of the fact that in doing so it involves an erference with the light which would other-e reach the said three windows. Further, B" may at any time within twenty years nterfere" with the light to the three windows, erecting on his own land something, such as oarding, which, from its nature, is likely to be a permanent character, and which in fact did erfere with the three lights for a year.

"B" therefore is entitled to suggest that agreement by deed or writing should entered into; and for "A" to pay nominal rent for the use of light to the ee windows. On the facts stated, and examination of the plans, &c., it would pear that "A" would be wise, in his own erests, to settle such an agreement on the t terms possible. In this connection it may stated that a writing signed by "A" and not "B" would hold as a sufficient agreement for purpose.

As to the second query, "A" has no right to erhang "B's" land with the casement erred to; and "B" can object to his doing so. is an act constituting a nuisance which "B" n abate by summarily removing the nuisance d without recourse to legal proceedings—a nedy which the law does not favour and ich it is unwise for any one to take into his n hands. The law provides that a person ured by a nuisance may bring an action ainst the tortfeasor, and claim damages for injury, either alone or in conjunction with claim for an injunction to restrain the con-uance of the nuisance. If it is proved (as would be in "B's" case) that there has been an invasion of his right by the act of "A," then "B" would be entitled to nominal damages, even though no actual damage be proved, since the law in such cases presumes damage because a continuance of the nuisance might and would eventually destroy "B's" right.—LAW.]

Demolishing Hollow Walls.

[REPLY TO MR. W. SANDELL, MARCH 25.]

SIR,—I am really much obliged to Mr. Sandell for his valuable information, which confirms a suspicion I already had. I think there is no doubt that slates in cement make the safest damp course, if carefully laid, and an everlasting one, and I thoroughly agree with Mr. Sandell that thin lead makes the safest protection round window and door openings. G. A.

Cement-Stucco.

[REPLY TO "A. B. C.," MARCH 25.]

SIR,—"Stucco," as a term, is generally used in English specifications to indicate the class of surface rather than the material. It generally means a smooth surface, like the plaster walls of a living room, but in cement work it is not only used to indicate the smooth face used where the cement is to be painted, but also the "rough-smooth" face of cement work with a true surface finished with a wood float.

PLASTER.

Multi-coloured Rustic Slates.

SIR,—I notice that this class of slate does not lay so tight as the ordinary Welsh slate. Can you tell me if it is safe to lay these to a pitch of 30 deg. under these circumstances?

NERVOUS.

Returning Bills of Quantities.

SIR,—We are sending an estimate for work to a borough council who have supplied bills of quantities. The surveyor asks us to return the bills of quantities priced in with our estimate. As this seems to us to be rather irregular, what is our position if we detach the form of tender from the bills of quantities and retain the bills of quantities? IRREGULAR.

Rule of Thumb for Pricing Timber.

[REPLY TO "TYBO," MARCH 11.]

SIR,—A simple formula for pricing timber which, so far as I am aware, has not been previously published, but which gives reasonably accurate results, is $S \times a$ = cost in pence per 100 ft. lineal,

where S = cost per Standard, expressed in £'s and decimal parts,

a = area of scantling in square inches.

If a more accurate result is required, use $(S \times a) + \frac{1}{110}(S \times a)$.

For example:—

Taking the first formula. To find cost of 100 ft. lin. of 6 in. × 3 in. at £30 per Standard $S \times a = 30 \times 18 = 540$d. per 100 ft. lin = 5.4d. per ft. lin.

By the second formula:—

$$(S \times a) + \frac{1}{100}(S \times a) = (30 \times 18 = 540) + \left(\frac{30 \times 18}{100} = 5.4\right) = 545.4\text{d. per 100 ft., or } 5.454\text{d. per ft. lineal, or, say, } 5\tfrac{1}{2}\text{d. per ft. lin.}$$

The difference is small and would usually be covered by rounding up the price to the nearest farthing above.

The accuracy may be checked very easily:—

A Standard = 165 ft. cube.

6 in. × 3 in. scantling = $\frac{1}{8}$ ft. cube ∴ No. of ft. lin. in 1 Standard = 165 × 8 = 1320 ft. lin.

£30 = 600 shillings, or 7,200d. $\frac{7200}{1320} = 5.45$d. per ft. lin., or, say, $5\tfrac{1}{2}$d. ft. lin., as before.

If the price per standard contains shillings these must be shown as a decimal part of £1. Thus £28 15s. = 28.75, and so on.

W. G. W.

SIR,—The method described by Mr. Atkinson is really the same as mine, except that I suggest £25 per standard as a very useful datum, being round about the actual price of a good many scantlings at the present day. By taking £25, my decimal becomes .25 according to Mr. Atkinson's rule, or one-quarter as I described, and I suggest this makes an even simpler mental sum than Mr. Atkinson's. Once the price per foot run at £25 is obtained, it is a simple matter to add or deduct the necessary odd half-pennies or pennies to conform to a different rate per standard. PRESTO.

Shops and Office Building, Sharrock-street, Southport.

MR. A. E. JACKSON, M.Inst.C.E., Borough Engineer.

(*See page 560*)

THE BUILDING TRADE

BY-LAWS RELATING TO BUILDINGS AND STREETS.—XIV

STREETS.—V.

Our space did not permit us in our last article to conclude our observations on the recommendation of the Committee on Building By-laws that building lines should be imposed by by-law, and that the Public Health (Building in Streets) Act 1888, be repealed. This appears to us one of the most difficult questions raised in the Report, especially since the more recent legislation as to building lines and improvement lines contained in the Roads Improvement Act 1925, and the Public Health Act 1925, to which we have referred in the last two articles, as a multiplicity of such lines appears a thing to be avoided.

As we showed in our twelfth article the Committee seem to have had two alternative policies under consideration, first a widening of the statute under which by-laws are made and the passing of a clause making definitely binding on owners and successive owners the conditions embodied in the by-laws under which streets are allowed to be laid out of less width if the houses are set back, so that the conditions will, as it were, run with the land (see paragraph 68 of the Report), which we understand would involve the retention of the Building in Streets Act (although the Report is a little obscure upon this point); and secondly the fixing of building lines by by-law, and apparently they decided on this second alternative for the summary of the recommendations contained in Chapter IX of the Report (paragraph 17) is as follows:

"That by-laws be authorised for fixing the distance between the buildings in new streets, and that the Public Health (Building in Streets) Act be repealed" and paragraph 68 in the body of the Report is referred to.

The "distance between buildings" here referred to must be the distance across the street, and not the distance between buildings at the same side of the street, the question involved in applying the provisions of the Building in Streets Act. As we pointed out in our last article, there are two classes of "new streets" to be considered, first a new street laid out on private property, and secondly "new streets" so called, where building development in the vicinity of an existing highway converts that highway, or part of it, into a "new street." The by-law provision lessening the width of the street to be laid out on condition that the houses are set back from the street would appear to have no application where the "new street" is already an existing highway, but the by-laws, especially since the passing of section 29 of the Public Health Act, 1925, apply to both classes of "new streets." The suggestion of the Committee providing for the fixing of building lines by by-law could, of course, apply to streets being newly laid out, subject to the drawbacks we pointed out in our last article as to the necessity either of taking more land at the laying out stage than should be required from the private owner without compensation, or of encouraging the creation of narrow streets which subsequently may have to be widened when compensation would be payable. The suggested building lines would, however, get over the difficulty referred to in the Report that conditions as to set-back of buildings under the existing system are possibly not binding upon successive owners.

It has to be admitted that the objections we have pointed out to fixing building lines appear to apply with equal force to the policy in the present by-laws of allowing the width of streets to be diminished on condition of the set back of houses, having regard to the legislation now passed as to improvement and building lines in the statutes of 1925, and in the light of that legislation it is possible that policy may have to be reviewed.

As regards "new streets" on existing highways, the recent legislation passed since the Committee reported may suffice, and the application of further building lines by by-law might only be the source of confusion, yet, as we have said, the by-laws apply to both classes of new streets. If the policy of allowing streets to be laid out of less than standard width on condition of the houses being set back is to be continued, there is still the alternative to the fixing of building lines which is indicated in paragraph 68 of the Report. A clause could be added to the statute under which the making of by-laws is authorised, making the condition as to set back binding on subsequent owners, and a unit would thus be obtained—the first house built in the street—for the application of the Building in Streets Act to operate, especially if that Act were amended to obviate the difficulties experienced in applying it where spaces occur between the houses. The retention of that Act also appears desirable, if amended as we suggested in our last article, to secure the set back of houses forming new streets on existing highways as an addition to the provisions of an improvement line under the Public Health Act, 1925. The whole question is one of extreme difficulty, and we have only attempted to direct attention to some of the considerations it involves.

One further observation may be made on the recommendations of the Committee on a different point. The Committee in paragraph 72 of the Report comments on the absence of a power, such as exists as regards buildings to prevent a street once laid out from being altered in such a way that if at first so constructed it would have contravened the by-laws, and they based this observation on Tarrant *v.* Woking Urban District Council (1914, K.B. 796). In that case the owners of a building estate, the predecessors in title of the appellant, had, in 1905, laid out a new street in accordance with the by-laws in force in the district. In 1913 the appellant erected across one end of the street street gates with piers which occupied 8 ft. 8 in. of the carriageway and 8 in. of the footway. The appellant was summoned for having, in June, 1913, constructed the carriageway and footway of less width than that required, in breach of the by-laws, and the justices had convicted the appellant. On appeal, a Divisional Court held that when once the construction of a new street has been completed no offence is committed against the by-laws by a subsequent diminution of the width of the carriageway or footways below the required minimum, and it was also held that section 157 of the Public Health Act, 1875, which authorises the making of by-laws "with respect to the level, width, and contruction" of new streets, does not authorise the making of a by-law which would make such a reduction of the original width an offence. The Committee recommended that power should be conferred to make such an alteration as would originally conflict with the by-laws an offence. The circumstances of the above case are somewhat peculiar as it appears rather to have been a case of obstruction than of any physical alteration in width, but the decision of the Court is as stated in the Report of the Committee.

As regards variations by local authorities when making up streets prior to taking them over in Robertson *v.* Bristol Corporaton (1900, 1 Q.B. 198), it was held that when an authority made up streets under section 150 of the Public Health Act, 1875, they had no power to vary the respective widths of the carriageway and footways because they must deal with the street as they found it dedicated to the public. This case has now been overruled by statutory enactment, as section of the Public Health Act, 1925, prov "Upon the exercise by an urban autho of the powers of section 150 of the Pu Health Act, 1875, or of the Private St Works Act, 1892, as the case may be, in r tion to any street, the urban authority s have power to require a variation of the r tive widths of the carriageway and footwa footways of the street; provided that no gre charge shall be imposed on a frontager reason of any such variation than could l been imposed in respect of a carriageway footway of the width prescribed for a street of the same class by any by-law enactment with respect to the width of streets which applied to the street wher was laid out, and any sum in excess of t charge shall be borne by the urban authorit As this provision is contained in a part of Act which by section 1, subsection (2), s be construed as one with the Public He Acts, 1875 to 1907, and as the Private St Works Act is also to be construed as with the Public Health Acts, no doubt power conferred by section 35 can be ferred on rural authorities in the manner scribed in those Acts.

In the attempt we have made to cons the effect of the legislation in the Pu Health Act, 1925, and the Roads Improvem Act, 1925, upon the recommendations of Committee, in self-defence we must point that those Acts are at present unexplo country, as no legal decisions have been given on the points raised, and therefore have only been able to express our opinion upon the points we have touched up

As we have alluded to some of the provisi of the Public Health Act, 1925, relating streets, although the following sections h no bearing upon the questions considered the Report of the Committee, we may draw our readers' attention to them.

Section 81 confers the same power on l authorities who make up streets under sect 150 of the Public Health Act, 1875, as is ferred by section 15 of the Private St Works Act, that is to say, if they think fit t can at any time resolve to contribute whole or a portion of the expenses of works.

Section 82, where works have been exec under section 150 of the Public Health A 1875, to the satisfaction of the local author confers the same powers as exist under sect 20 of the Private Street Works Act on majority in rateable value of the owners of houses or land in the street to require the l authority to declare the street to be a hi way repairable by the inhabitants at larg

Section 83, for the purpose of remov doubts, declares that the purposes mentio in section 154 of the Public Health Act, 18 which relates to the purchase of premises the widening, opening, enlarging or oth wise improving any street or for the mak of any new street, include the improveme and development of frontages or of the la abutting on or adjacent to any street.

An explanatory Memorandum issued by Ministry of Health explained this section follows: "For many years both the Lo Government Board and the Minister allov lands which would not abut upon a wide street to be included in a provisional or for compulsory purchase where the lo authority was able to bring forward g reason in support of this course. The corre ness of this practice has recently been qu tioned, but section 83 makes it clear t under section 154 of the Act of 1875 land the improvement and development of fro ages, or of the land abutting or adjacent any street may be purchased by a local aut rity. Section 83 extends to a purchase of la by agreement as well as to a compulsory p chase of land." This apparently refers to s tion 175 of the Public Health Act, 1875.

RAFTSMEN AND THEIR MATERIALS

H. JARMAN, of His Majesty's Office of , contributed a paper on this subject series of lectures confined to workers in ilding trades, at the R.I.B.A., 9, Conduit- on Tuesday, March 22. Material, said ecturer, in its varying forms, was the ity of the craftsmen, and from time norial has been used to display the artistic f man's thought and illustrate his ideas as s to provide the necessary means of nce. Historic antiquity had preserved raftsman's art, which could be traced gh past ages, the craftsmen at all times ng in the material to hand which had d on to us such of the arts and crafts as n. It began in what was known as the Age when men lived by the chase from to day and displayed some wonderful uity in shaping flints and other stones eir needs, as might be seen in any of our ums in London to-day. Then followed Bronze Age when men through some un- n source discovered the use of metals, nessed by some of the ancient tools formed pper and copper alloys, again to be seen in nuseums, but doubtless the better working material had a rapid growth, both in its y and in the artistic sense, on the discovery n. The further research was pursued, the clearly was the process of the development e art of the craftsman seen from the crude ngs of primitive man to the highest degrees ned in all classes of material. The lecturer dealt with some materials in use to-day. rding concrete, he said that, as a building rial, it was undoubtedly very valuable, ially for warehouses and like structures. mbination with steel it was undoubtedly ry serviceable material. Regarding the gate, absolute cleanliness was the greatest first consideration. Concrete had failed bly more often from being unclean than any other cause; aggregates should be dered from the standpoint of what nature rk was to follow, or the uses and stresses hich it would be subjected. Crushed nes ballast, washed and graded, was un- tedly the finest. Crushed granite was ise an excellent material, but mechanical ing was conducive to much dust, which, e aggregate was at all damp, stuck to the ces, forming a film, which stopped adhesion e cement and was a source of failure.

ished vitreous clinker ash was a good rial, as was also the slag from smelting ces. Coke breeze, in any form, he disliked, e could never be sure if it was clear of coal lphur, which set up oxidisation in steel orcement. Clean water in mixing and clean were the essence of success for this kind of rial.

e lecturer then dealt with bricks, some mples of which at the British Museum, from Mesopotamian area, were reputed to date to 5,000 B.C. The Israelites in their vity in Egypt made bricks. Pliny, the ian historian, mentioned a floating brick, t art for many centuries, rediscovered by M. Fabroni in the middle of last century. Romans were great brick makers and un- tedly brought the art to this country, an hich had fluctuated throughout our history, probably reached its highest attainment e days of Henry VIII, there being no finer mple of brickwork than the chimneys of mpton Court Palace, and later in many old bethan mansions still extant. It blossomed considerably in what we were pleased to the Georgian period. There was nothing n to enlighten us as to how bricks were e by the people above referred to, but there little doubt they were all hand-made, and by the best and most appreciated bricks r for tone in colour schemes or use by the sman were mostly hand-made. The fire- brick earth also very largely formed the basis rra-cotta. Bricks that were machine made when laid a metallic look about them in evenness of shape and colour which was otonous, and all machine-made bricks were to be relied upon for weathering properties to the same degree as could be relied upon by most hand-made bricks.

The lecturer then spoke on terra-cotta, which, he said, had not in this country been at all times an unqualified success. Clays were not always free of salts in the manufacture, and a tendency on the part of manufacturers in mid-Victorian era to bend to fads and fancies of the time instead of going out deliberately and telling users if the colour demanded was to be obtained it could only be done by a sacrifice of efficiency in firing, had not helped. There was also a tendency to face the material with a finer texture producing unequal shrinkage in firing, resulting in peeling of the face, and the under-burning before mentioned not being of sufficient density to withstand atmospheric attacks and erosion.

The lecturer then gave some information regarding bricklayers, bricks and brickmaking in ancient times. Bricklayers' wages in 1309, he said, were recorded as 4d. per day in Oxford; at Beverley, Yorks, 1409, also 4d.; at Oxford, 1503, 5d.; at Cambridge, 1603, 1s.; and at London, 1703, 4s. 6d., all being for bricklayer and mate. Bricks were made at Hull in 1303, the price being 3s. 1½d. per M. In 1404, at York, they cost 5s. 2½d. per M., including cartage, and in 1433, at Beverley, in Yorks, 4s., called by the name of Walltiles, spelt Walleteill. Beverley gave a lot of history to the brick and tile trade. In 1307–27, wall tiles were made for Ely Cathedral, price 3s. 8d. per M., while in 1357, tiles for fireplaces at Westminster cost 8s. 2d. per M. In 1449, Cambridge bricks sold at 5s. 9d. per M., while records also show that in 1518, Cambridge (King's College) was supplied with 23,250 at 6s. per M. They also show that in 1625 some brickmakers had been profiteering and an Act or Proclamation was made forbidding a higher price than 8s. per M. In 1722, bricks were costing 16s. per M, and London place bricks 11s. at the kiln, while by 1749 prices had increased to 20s. to 22s. at kiln, and by 1756 fine old red bricks for cutting cost 50s. per M.

Houghton, in his writings about 1683, gave the number of bricks a man should make as 1,000 per day, with a man to temper the clay and a boy to stack, 2,000, or an extraordinary man 3,000.

Beverley Ordinancies, York, contained much information. In 1461 it was provided that wage receivers or hired men called journeymen should observe the ordinances made as to them. It was also laid down that no carpenter, tiler or plasterer (the tiler here referred to was a wall tiler previously mentioned, otherwise bricklayer, who had no apprentice who worked with him) should employ a journeyman without the consent of the master of works with whom he worked. The working hours at that period were from Easter to August 4 a.m. to 7 p.m., September to Easter, daylight to dark. It was also provided that no craftsman should refuse to work with any burgess who wants him unless he was previously engaged on some other work, the penalty being a fine of 6s. 8d. During the building of Whitgift Hospital in 1596, where Henry Blease and John Greene jointly took charge of the brickwork, it was recorded of Blease that he appropriated from a bricklayer named Kilner 2d. out of his wage of 14d. per day. Blease was taken to task for his usury and reported to the Archbishop of Canterbury by the Rev. S. Finch, who said he should not have his will. Batty Langley, writing in 1749, gave much information relating to bricks and bricklayers, how bricks should be made, how many per day and laid per day, his comments beginning at about 1660. This writer also quoted ordinances, saying when the brick earths were to be dug and stacked. The mediæval bricks were made by hands in moulds and burnt with wood in both stacks and kilns, but much trouble arose from burning. Ducarel recorded the history of Croydon and the trouble they had with bricks, the brickmaker having been recounted as weeping over his troubles. Early English and mediæval bricks were generally smaller, and early charters from 1425–6 regulated the sizes as well as prices.

One of these charters was granted by Queen Elizabeth in 1567 to one Thomas Spencer and all other freemen engaged in the mysteries of the art of tilers and brickmakers within a radius of 15 miles of London. Bricks were taxed for revenue purposes from 1784, the tax being repealed in 1850. Tax was evaded by increasing sizes as bricks were taxed by numbers.

Speaking of tiles, the lecturer said that for the purpose of tile making it was essential that the clays be dug early, stacked and weathered thoroughly, as the clay was subject to physical and possibly biological change as well. Therefore the longer it could be left to let nature act upon it, the better was the clay mixture and the better the resultant tile.

The lecturer then gave some short account of slates.

British-produced slates, he said, attained the highest position for quality in this type of rock or stone. The geological formation was, if we could believe the results of research into their probable deposition, an intensely interesting subject. Slates were the result probably of ages of erosion deposited as a sediment for further countless ages, and as time passed the massed deposits consolidated and hardened under pressure and heat. Cooling and contracting of the earth's surface lifted these deposits up, forming what was now our slate quarries, such as those in Wales and Cornwall. There were two kinds of slates, one kind being deposition by erosion of former rocks and deposited at the mouths of rivers in thin layers of gradually increasing thickness, the other being volcanic in origin. The cleavage of this latter was poorly developed and regular sizes were not easily obtained. Slates were quarried in Ireland, America, Norway, France, Germany, Spain, Italy, Canada, Portugal, &c., but the most important and the best were British. The earliest worked was probably in Delaboles, of which records exist of these being quarried in 1602. A legend had it that slates were quarried in France in the sixth century, but authentic evidence existed, said the lecturer, that slates were quarried at Angiers in the twelfth century.

Welsh slates differed in colour from the Delabole slate, as they ran between a very dark bluish pink to almost red with large green patches on some of them. The Welsh quarries in their best veins produced probably the most evenly plain-faced slates in the world. For fineness of texture and evenness of grain and in work, their close-fitting surface was not to be approached.

(To be continued.)

"The Municipal Year Book."*

The 1927 volume of this annual, just issued, fully maintains its value as a book of reference for all who are in any way concerned with or interested in local government. Its standard features are so well-known that they need not be here recapitulated. Let it suffice to say that the whole volume has been thoroughly revised and brought up to date, and various improvements have been incorporated. Mr. Neville Chamberlain, Minister of Health, contributes an introductory article on "Reforms in Local Government," in which, among other matters, he refers to the growth of Regional Committees, and urges that there is room for regional co-operation in many spheres of local government activity besides town planning. "What is most needed," he writes, "is that adjacent authorities should come together for the mature consideration and frank discussion of their common problems in order that they may arrive at a common policy in dealing with them and that, where improvements are necessary for the common good of all, each should contribute in equitable measure." Mr. Chamberlain warmly commends the efforts made by local authorities and private enterprise to overcome the housing shortage, mentioning that during last year nearly 200,000 were erected—a record far exceeding anything hitherto achieved, even before the war.

LAW REPORT

[KING'S BENCH DIVISION.]

(Before Mr. Justice Greer and a Special Jury.)

BUILDERS' ACTION FOR ALLEGED LIBEL ON QUESTION OF "WAGE-RATE DEFAULT."

Bovis, Ltd., v. Thorne and Others.

THE hearing was continued of this case in which Messrs. Bovis, Ltd., builders, contractors and decorators, of Upper Berkeley-street, W., claimed from Mr. F. Thorne, late President of the London Master Builders' Association, and four other members and officers of the Association, damages for alleged libel.

Mr. H. T. Holloway further cross-examined, admitted that on June 22, 1924, after he knew of the assurances of Bovis, Ltd., that they were paying standard wages, the London Master Builders' Association sent to some 1,700 different addresses a statement that a certain other firm had ceased to be in wage-rate default. Although the people who were thus circularised had received the notice that the plaintiffs were in wage-rate default, the Association did not inform them that the plaintiffs were then paying the standard rate of wages.

Sir John Simon: That left Bovis, Ltd., under the same stigma which you placed upon them in April?—Yes.

You deliberately left Bovis, Ltd., under the same stigma, although you knew of the letter from that firm stating that they were paying standard wages and nothing else?—Yes.

Looking at it as a fair-minded man, don't you think that as you had originally sent round a document in April, which might make people think that the plaintiffs' sin had some thing to do with the rate of wages, you ought, when you were circularising the same people in June to have said that whatever the fault was that was complained of before, there was now no complaint about the rate of wages?—One cannot say that one would not be wise after the event, but Bovis, Ltd., were still in wage-rate default and there was no means under the by-laws of removing them from the list of such defaulters.

Sir John Simon: Was the object of your Association's by-law policy to make unfederated firms uncomfortable, or to enforce standard wages among your own members?—To force standard wages on all builders, whether they were members or not. It was to make unfederated firms come into the Association or to undertake the same obligations that the members had.

In reply to the Judge, Mr. Holloway said that the Association sent the alleged libel to provincial builders to prevent them from tendering against firms who were in wage-rate default. He admitted that on one occasion his firm had inadvertently tendered against such a firm.

The witness, re-examined, denied that he had any desire to publish anything defamatory of any firm.

At this stage, his lordship said that, in view of the evidence which had been given, he was not so sure that the communications to federated societies were privileged. If he were to attempt to pick out from the list of upward of 1,700 recipients of the alleged libel, the case to which privilege applied, and those to which it did not, no one could foresee when the case would end.

Sir John Simon said he would accept his lordship's opinion that privilege extended to members of the Association, but he was not prepared to admit that it went beyond that ambit.

Further re-examined, the witness said that the policy of the Association had been absolutely justified, and had saved the situation. He thought that, having weathered the storm, they could now dispense with the by-laws.

Mr. John E. Drower, F.S.I., Quantity Surveyor to the London County Council, examined, said that from a national point of view it was essential that there should be a strong body of employers on the one side to meet the highly organised body of operatives on the other, and that wages should be standardised.

Mr. Fred Thorne, one of the defendants, and president of the London Master Builders' Association in 1925, examined by Mr. Bevan, was referred to a letter which Mr. Thorne's firm had sent to Mr. Harley, an architect (borough engineer and surveyor of Poplar) on March 30, 1925, in which they said that they would be pleased to tender for a clinic provided that Bovis, Ltd., and three other firms in wage-rate default as defined by the London Master Builders' Association, were not in the list. Mr. Thorne said he regretted that he wrote that letter. He did not do it spitefully. It was his idea to get peace in the industry. There were two or more firms who had gone out to pay more than the standard rate of wages, and that was creating trouble. Acting in the capacity as president, upon whom great responsibility rested, he visited the offices of Higgs & Hill, Ltd., on June 5, 1925. He saw the two Mr. Hills and Mr. Joseph, of Bovis, Ltd. He thought that that was an opportunity of reconciling them to the Association and suggested that both firms should return to the Association, sign Form "A," and come under the same regulations as their fellow members. He promised that on their return notices should be published in the Press, and that letters should be sent to all the persons to whom all the circulars and by-laws had been sent previously, stating that Higgs & Hill, Ltd., and Bovis, Ltd., were again in full membership, differences between them and the Association having been amicably settled. He admitted that Bovis, Ltd., had written saying that they had not paid more than standard wages since April 17. In publishing the documents complained of it never occurred to him that the language used could be construed in a defamatory sense of Bovis, Ltd..

Cross-examined by Mr. Willes: Do you suggest that Bovis, Ltd., left the Association in order to pay more than the standard wages?—They did.

You know that they say that they went out because they had been badly treated over tenders?—Yes, but Mr. Gluckstein and Mr. Joseph have both admitted in Court that they paid more than the standard wages down to April 17, 1925.

Sir Walter Lawrence, another of the defendants, examined, said he was president of the Association in 1913 and 1914, since when he had been on the Council. Soon after the lock-out he met a number of leading builders, members of the Association, to consider labour conditions, and a special Committee of the Council was formed, of which he was a member. They came to the conclusion that the only way out of the state of chaos which existed was to insist upon standard wages. The by-laws were not directed against any firm in particular on personal grounds. The policy expressed in them was considered to be the best way out of the difficulty which confronted them. The desire was to see that no one paid more than the standard wages. It was of vital importance that the employers should stand together, and the second part of Form "A" was very necessary.

Mr. W. J. Rudderham, the last of the five defendants, and the Secretary of the London Master Builders' Association, since 1919, examined said he had no feeling of ill-will towards Bovis, Ltd., and that he had done nothing in the matter but what he was told to do by his employers.

At the conclusion of the evidence,

Mr. Bevan submitted that the publications of the alleged libels to the public bodies and firms in the supplemental list and also to the architects whose names appeared as such in the London Directory was privileged.

His lordship said he would like to have some evidence whether the public bodies and firms in question were in the habit of inviting tenders from London builders.

Mr. Thorne was then recalled and gave evidence that the public authorities and firms mentioned in the supplemental list invited tenders in respect of building work.

Mr. Bevan said that the Association had circularised all the architects in the London area whose names appeared in the London Directory under the heading "Architects," and his contention was that this dispute being a matter in which builders and architects had a [illegible] interest, privilege extended to all those who themselves out as to be practising archit

His lordship said he hoped he would n to try another libel action in which h have to distinguish which out of 1,740 tions were privileged and which were not

Mr. Bevan submitted that it was *pri* evidence that the architects whose appeared as architects in the trade portio London Directory were practising the pr

His lordship said that he was not sat to that. The question of privilege was a one to decide. He thought that in son the defendants had gone beyond the area was legitimate.

Mr. Willes said he would not insist u fifth libel going to the jury. In his sub there was no evidence that all the archi whom the circulars had been sent had a interest with the builders.

His lordship then ruled that as regar supplemental list the matter complained published to all the public bodies and pe that list on a privileged occasion. With to the other publications, a very consi number of the London architects, to wh alleged libels were published, were tho were in the active exercise of the profess might, within a reasonable time, have consider what firms should be invited to and the publications to them were on leged occasion. There were, however viduals in the list who had neither a d an interest in regard to the subject of the libels and in those cases the jury would troubled with the question whether express malice had been proved. The qu which he provisionally proposed to leave jury were:—

(1) Was the letter of April 8, 1925, on the plaintiffs, (*a*) because it mean was stated in the innuendo; or (*b*) beca words used were defamatory in the o meaning?

(2) A similar question with regard other three documents complained of.

(3) In publishing the alleged libels w defendants, or some or one of them, gu malice?

His lordship said he had in framin question left out of consideration the fact that Mr. Thorne had sent a letter or two too soon. That was of little impo

(4) If you (the jury) answer the third q in the affirmative, what damages do you in regard to all the publications? If negative what damages do you award case of the publications which were not leged?

Counsel having addressed the jury on of their respective clients, and his lo having summed up, the jury in answer specific questions left to them found th documents complained of by the pla were defamatory in the ordinary me and that the libels were not true, but found that the defendants were not ac by malice. In respect of the publicati the libels on occasions that were not privi they awarded the plaintiffs £25 damage

---

Concrete House Novelty.

A novel system of concrete construction understand, being used at Cambridge f erection of some 30 houses by the Cam Corporation. The walls of the houses ar structed of large slabs of concrete cast on zontal wood platforms. The door and w frames are placed on the platforms and the cast round them. The walls are then pla position in a few minutes by a specially des crane, and it is claimed that at least one a day can easily be erected. The casting walls is done by unskilled labour and no sca ing is required.

The original patent is Dutch, and 170 h in Amsterdam have been built on this s and inhabited for four years. They are s be satisfactory in every respect. The Cam houses are the first to be erected in this co on this system. The price of the houses built by the borough of Cambridge work at £467 per house.

ICORPORATED BRITISH ISTITUTE OF CERTIFIED CARPENTERS

The annual dinner of this Institute was held Saturday, March 26, at Carpenters' Hall, ogmorton-avenue, E.C.2, Mr. H. Westbury ston (Master of the Worshipful Company Carpenters) presiding over a gathering of ut 200.

fter the loyal toast had been honoured, Mr. Hutton Freeman (Clerk of the Worshipful mpany) in proposing the toast of "The titute," said he could remember the time n the Institute was only twelve strong; they were about 540 strong. He thought might fairly say that the Institute had e to manhood, and when one thought of the work that went to make men capable taking the certificate of the Carpenters' mpany, he felt that he ought to congratulate n on their achievement. Carpentry was ly one of the most ancient, historical, and t beautiful of all the crafts. In conclusion, hoped the Institute would go on from ngth to strength.

Ir. Wm. Cox (Vice-President of the Insti-), responding, said although there were a lot of benefits that a man might look ard to receiving by membership of the itute, after all, they wanted to do what old carpenters did years ago. They had to look at the panel in the room which were then in, giving the names of the sters of the Worshipful Company as far as the fifteenth century, and to read its ory to understand how the Company had me such an exclusive body. The Worship-Company had various civic privileges; a mber could be a Lord Mayor of London or eriff of the City. The Worshipful Company done a lot for the Institute, and he hoped would continue to carry on the work.

r. G. Ayres (Vice-President of the Insti-), proposing the toast of "The Worshipful mpany of Carpenters," said after their In-te had been formed it would have been ossible for it to continue to exist unless the penters' Company in their graciousness had afforded them a number of facilities for ting together and providing lecturers for benefit of the members. Since the forma- of the Institute their President had always a member of the Company—either the ng Master or the Past Master.

r. Adam Smith (Senior Warden of the shipful Company), responding, said in t six years they would be celebrating the pany's 600th anniversary, so that there been time in the interval to work up a t many institutions for the benefit of suc-ing generations. The Court of the Com- were always anxious to do anything to st in the shape of instruction or addresses. Institute was one of the branches of the shipful Company. It had only been in ence for about 36 years, but he thought result of that evening's entertainment was oof that there was a great amount of life he Institute. The speaker then called ntion to the series of lectures lately given he R.I.B.A. to craftsmen and artisans in different trades. The lectures provided of a most useful character, and he hoped e of the members of the Institute of Car-ers had taken advantage of them and nded some of the meetings. Turning to the tion of apprenticeship, the speaker said the housing schemes carried out up and n the country had resulted in the recruiting ,000 apprentices to the building trade from erection of, roughly, 60,000 houses. There been a scheme formulated in Manchester which apprentices would be bound to the e and not to actual employers. He did not w how this would work out, because he onally felt that if an apprentice was bound n individual employer he would be assisted greater extent in his work than if d to the industry itself. Mr. Ayres, ng referred to the fact that their late Secretary, Mr. J. T. Preston, had been compelled to relinquish office owing to the result of war service, said that during his (Mr. Preston's) term of office the membership had greatly increased and the enthusiasm had increased still more. It gave him great pleasure to ask the Chairman to hand to Mr. Preston a small token of regard from the members of the Institute.

At this juncture, after a short and appropriate speech, the Chairman presented a gold watch chain to Mr. Preston.

Mr. Preston, in returning thanks, said it was a matter of deep regret to him that, on the advice of his medical adviser, he had to tender his resignation as Secretary of the Institute.

The toast of "The Chairman" was proposed by Mr. W. T. Sweett (Vice-President of the Institute), and the Chairman replied.

The concluding toast, that of "Our Guests," was proposed by Mr. R. J. Back, and responded to by Professor C. H. Reilly.

WHITE LEAD AND ITS PRODUCTION

Mr. C. J. Game, of Bournemouth, delivered a lecture on this subject to the members of the Exmouth Rotary Club on Tuesday, March 15. The lecturer said that white lead, mixed with linseed oil, turpentine, and some form of drier, had been in use as a paint and preservative of wood, stone, iron and other substances for as long as authentic history took them. No other compound had been so extensively or generally used, and it might therefore be reasonably assumed that its equal or superior as a protective from the destructive influence of atmospheric effects had not so far been discovered. Its peculiar efficiency resulted from the fact that white lead had a greater affinity for linseed oil than was possessed by any other pigment, and the lead and oil, assisting and supporting each other, when they had been applied and became dry on the work, formed a complete film or skin which offered the maximum resistance to destructive climatic influences. Naturally when the decorative effect of red, green or other bright colour was desired white lead could not be employed, or at any rate only partially, but the practical painter always prepared his work with preliminary coats of white lead, knowing that his brighter finishing colour was decorative only and could not by itself act as a satisfactory preservative. White paints were also produced from zinc or other substances. The resulting paint was sometimes a very brilliant white, whiter than white lead, and when the expense was not a primary consideration a final coating of such a paint gave a very pleasing finish to the work. Nevertheless, none of these other compounds blended so perfectly and permanently with the oil. The ingredients tended to separate from corrosive atmospheric effect, the oil dried out and perished, and the solid constituents of the paint powdered off and fell away.

National Housing and Town Planning Council.

This Council has arranged to hold, as in previous years, a series of Regional Conferences of Local Authorities in different parts of England and Wales. The centres to be visited this year are London, Manchester, Leeds, Newcastle-upon-Tyne, Birmingham, Nottingham, Plymouth, Bristol, Portsmouth, Cambridge, Cardiff and Llandudno. The agenda for the conferences embraces many important subjects, including the administration of the Housing Acts, the maintenance of good standards of planning and design, the problem of the slum, the rural housing problem, the preservation of rural England, and town and regional planning. Full particulars may be obtained on application to the Council's offices, at 41, Russell-square, London, W.C.1.

PRICES OF BUILDING MATERIALS

The Chairman of the Inter-departmental Committee appointed to survey the prices of building materials has now reported to the Minister of Health and the President of the Board of Trade for the period up to February, 1927. For purposes of comparison, the schedule includes also prices for April, 1914, and January, 1924.

The Chairman writes as follows:—

"The last published schedule, which included prices for the month of November, revealed marked advances in the prices of bricks, both common and facing (but excluding Flettons), cement, cast-iron goods, glazed ware, and tiles. These advances were attributable to the increased cost of fuel consequent on the coal stoppage. After the lapse of three months, during which conditions may be said to have become more or less normal, it will be of interest to observe how far the prices of building materials have responded to lower fuel costs.

"As regards *bricks*, prices have moved downwards in most districts, but it is noteworthy that the level of prices, with few exceptions, still remains higher than before the coal stoppage. On the other hand, the price of *Portland cement* is now, in most districts, practically back to the level of last May, but *lime*, though generally cheaper, still shows increases ranging up to 17s. per ton.

"Falls of varying amounts are recorded in the prices of *cast-iron goods* and *glazed ware*, but here again most articles in these categories are still dearer than in May last. Exceptions, however, are rain-water goods and soil pipes in Scotland, and baths in Leicester, Manchester, and Scotland, the prices of which compare favourably with those ruling nine months ago

"No reduction has taken place in *tiles*, the prices of which remain at the level reached in November. As regards other articles, *timber* shows a tendency to rise in some districts. *Lead*, however, which has now been declining in price for several months, shows another marked decrease, amounting in Scotland to as much as £8—£8 10s. per ton for sheet lead, and £6—£6 10s. per ton for lead piping.

"In presenting the schedule for November, I reported that the Committee were of opinion, in view of the abnormal conditions then existing, that any analysis of prices would not at that time serve any useful purpose, but that as soon as a period of stability had been reached, the position would again be reviewed. This review has now been made, and the Committee have formed the opinion that, having regard to the general high level at which the prices of certain articles continue to be maintained, further investigation is called for. A sub-committee has accordingly been appointed to enquire into the reasonableness of present prices, so far as is consonant with the terms of reference to the Committee. It is proposed to investigate first the prices of bricks, dealing later with other materials."

The constitution of the Committee is as follows:—Major J. W. Hills, M.P. (Chairman), A. V. Alexander, M.P., Sir Theodore Chambers, K.B.E., Sir J. Walker Smith, M.Inst.C.E., R. Coppock, C. E. France, G. Hicks, C. K. Hobson, M.B.E., J. Stanley Holmes, H. J. C. Johnston, W. T. Lancashire, M.Inst.C.E., Lieut.-Col. C. B. Levita, C.B.E., M.V.O., D.L., J.P., D. Ronald, M.Inst.C.E., F. Thorne, Raymond Unwin, F.R.I.B.A., W. H. Wright. Secretary to the Committee, P. Davenport.

The Report may be obtained, price 4d. net, on application to H.M. Stationery Office.

Speed in Building Construction.

Mr. J. G. Kay, A.M.I.N.A., M.I.Struct.E., delivered a lecture recently, on "Ciment Fondu—Its Relation to Economical Construction," to the members of the Birmingham Architectural Association, in the Assembly Hall, Chamber of Commerce, Birmingham.

Prestige & Co., Ltd., 149, Grosvenor-road, S.W.1, for acceptance. The amount of the tender is £30,670.

Woolwich.—CHURCH.—The Rev. Abbot White is to purchase a site from the Woolwich Borough Council for the erection of a church and school in Appleton-road.

Wandsworth Technical Institute.

On Saturday last some thirty members of the Architectural and Building classes of this Institute made the first of a series of long distance trips to places of technical interest. Leaving Paddington at 7.15 a.m. in charge of Mr. George Arnall, F.S.I., &c., and Mr. C. J. Dobson, P.A.S.I., &c., the party was met at Corsham Wilts, by Mr. H. B. Chaffey, on behalf of the Bath & Portland Stone Firms. The works at Monk's Park were reached by motor, and after viewing masonry operations the party descended one of the many local quarries and witnessed the various operations in winning stone from tunnels some 100 ft. below ground. Continuing by motor to Bath, and after lunch, Mr. John Hatton, manager of the Baths, courteously conducted the party round the extensive curative establishment, and later, round the old Roman Baths, explaining the latest discoveries from recent excavations. Later Mr. Arnall acted as guide in and around the old Abbey.

"Modern Building."

"Modern Building" is the title of the special number issued with this week's *Manchester Guardian* "Commercial," to which many of the foremost architects of the day have contributed their impressions of the tendencies of design and construction. Mr. H. S. Goodhart Rendel writes on the architecture of commerce; Professor Ragnar Ostberg, architect of Stockholm Town Hall, discusses the importance of the craftsman's co-operation in successful construction; Mr. Nathaniel Lloyd reviews the modern use of brick; Professor Beresford Pite surveys recent London buildings; and Professor A. E. Richardson writes on modern bank design. Town planning, country and suburban house design, the construction of department stores and of factories, the uses of concrete, plywood, and flooring materials are covered in other articles. Mr. H. S. Fairhurst writes of the influence of American architecture. A notable feature of the number is the amount of space given to illustrations, which include some excellent examples of modern architecture in England, on the Continent, in America, and in various parts of the Empire.

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

Following is a list of abbreviations:— Borough Surveyor, B.S.; Borough Engineer, B.E.; District Surveyor D.S.; Clerk, C.; Town Clerk, T.C.; County Engineer, C.E.; County Surveyor, C.S.; County Architect, C.A. Surveyor, S; Engineer, E; Borough Architect, B.A.; Architect, A.

★—**Trinidad.**—CONCRETE FOREMAN.—Required by the Government of Trinidad, for two years' service. Apply at once, Crown Agents for the Colonies, 4, Millbank, London, S.W. 1, quoting M/15071.

Surface Brightness of Diffusing Glassware.

It is now generally recognised by those interested in the provision of artificial lighting that most modern light sources are so bright as to interfere seriously with comfort and visual performance unless they are either far removed from the line of sight, or, alternatively, surrounded with a diffusing glass bowl or similar device, which, by greatly increasing the luminous area, diminishes its brightness to a comfortable value. The bowl becomes the effective source of light, and its larger size has the additional advantage of producing softer shadows than those given by the bare source. In compliance with a request received from the British Engineering Standards Association, arrangements were made for experiments to be carried out at the National Physical Laboratory with the object of obtaining reliable information on the properties of diffusing glassware, and the surface brightness of a number of bowls of different types was measured. A report of the Illumination Research Committee gives the results of the work, which will be of interest to illuminating engineers, architects and others. Methods of measuring brightness, description of bowls, description of tests, and results of tests are among the contents of the report (No. 4), which may be obtained from H.M. Stationery Office, price 9d. net.

PROPOSED NEW BUILDINGS & OTHER WORKS*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education; M.A.B. for Metropolitan Asylums Board; and M.W.B. for Metropolitan Water Board.

Following is a list of abbreviations:—Borough Surveyor, B.S.; Borough Engineer, B.E.; District Surveyor, D.S.; Clerk, C.; Town Clerk, T.C.; County Engineer, C.E.; County Surveyor, C.S.; County Architect, C.A.; Surveyor, S.; Engineer, E.; Borough Architect, B.A.; Architect, A.

YORK.—T.C. passed plans: W. West, 4 hou Glen-av.; C. Martin, 3 houses, Campleshon-rd.

ESTIMATING ON RIGHT LINES

Everyone whose business it is to quote for building work should master the principles upon which estimating is based. These principles are clearly explained and illustrated in

'HOW TO ESTIMATE'

by J. T. REA,

a unique and invaluable work which is not excelled in thoroughness or in scope by any similar book known.

Fourth edition (now ready). 540 pages. Price 15s. net (by post 15s. 9d.). Containing thousands of prices and hundreds of examples of analysis, showing how a builder can make up rates for himself. In view of the difficulty of fixing standard prices under present conditions, the author has included an important series of Adaptation Tables and Percentages (corrected to February, 1927), *which show how rates may be adjusted to meet variations at any time.*

Before purchasing any other book on this vitally important subject, you are invited to inspect this—the standard work which is in use by over 30,000 builders.

A COPY WILL BE SENT BY RETURN, AND YOUR REMITTANCE REFUNDED IF THE BOOK DOES NOT SATISFY YOUR REQUIREMENTS.

Regional Planning in Lancashire.

The scheme for the regional planning Lancaster, Morecambe and district, prepa for the Joint Town-planning Committee Mr. J. H. Forshaw, has just been published the University Press of Liverpool. It has b passed for submission to the Municipal Borou of Lancaster and Morecambe, and the Dist Councils of Heysham, Carnforth, and Lancas It will be used as a basis for regional deve ment, so as to enable the individual local au rities to evolve their own planning schei Professor Patrick Abercrombie points out in introduction: "It is here no question of inevitable industrial or residential gro penned within narrow compass and requi necessary room for expansion, but of the r easily controlled sporadic building or b conceived road planning, or even inart afforestation, which can do such widesp damage." The district covers some 106¼ sq miles and contains a resident population over 77,000; while during the holiday sea at Morecambe alone there is an average o population of 90,000.

Merchandise Marks Act, 1926.

The Standing Committee (General Merchandise) announce that they will begin the inquiry with regard to certain descriptions of imported iron and steel on Monday, April 25, at 2 p.m., and, if necessary, the Committee will sit on the morning and afternoon of Tuesday and Wednesday, April 26 and 27. The descriptions of iron and steel covered by the inquiry are as follows:—

(1) Steel—

Plates, rails, joists, angles, channels, sectional material of all descriptions, castings, forgings, rounds, squares, flats, hexagons, hoops, hot and cold rolled strip.

(2) Wrought iron—

Bars, hoops, sections, plates and sheets.

The dates on which the inquiries with regard to imported gold and silver leaf, and imported silk and cotton woven labels will be begun will be notified later. The sittings of the Committee, which will be open to the public, will be held in Room 74A, first floor, New Public Offices, Great George-street, London, S.W.1.

Representatives of any interests substantially affected by the applications made for the purpose of requiring the above-mentioned classes and descriptions of goods to bear an indication of origin, who desire to be heard in opposition, are requested to communicate with the Secretary of the Committee, Mr. E. W. Reardon, at the New Public Offices, Great George-street, London, S.W.1, with the least possible delay and, if practicable, not later than April 19.

Building Trade Unions.

It was anticipated that the plasterers and bricklayers, whose unions had withdrawn from the National Federation of Building Trade Operatives, would be critical of the scheme which has been put forward for the formation of a new confederation of building trade unions. Dissent from the proposals (says the *Times*) has been definitely announced by the plasterers. The secretary of the National Association of Plasterers, Granolithic and Cement Workers states this association is the only recognised union covering operative plasterers and cement finishers in England and Wales, and it has not taken any part in considering or formulating the proposed scheme.

THE SCOTTISH BUILDE

NEW BUILDINGS IN SCOTLAND

Aberdeen.—ADDITIONS.—The Aberdeen Magistrates have approved plans for extensions to the Grand Central Picture House. The proprietor, Mr. J. F. Donald, has taken over the property at 296–300, George-street, which adjoins his present cinema hall, with the intention of increasing the seating accommodation to hold 1,339 people instead of 750 as at present. With regards to the alterations to the New Palladium, more accommodation for people waiting for admission to the hall will be allowed. The plan for the dance hall and the variety pavilion at the Sea Beach, which form part of the proposed scheme of buildings to be erected at the sea front by the Town Council, have also been approved.

Aberdeen.—CLUB.—Important improvements and extensions are being carried out at the Cowdray Club. The cost of carrying out the extensions will involve an expenditure on the structure and furnishings of probably £10,000 to £12,000.

Aberdeen.—EXTENSION.—Estimated to provide work for 150 men and to cost £34,360, the extension of Anderson-drive southward from Great Western-road to the Bridge of Dee, forming part of the new ring road, is to be proceeded with.

Aberdeen.—BUILDING.—Lord Provost Lewis, of Aberdeen, has issued an appeal on behalf of the Royal Infirmary section of the Aberdeen joint hospitals scheme. The scheme for the erection of a building for the new Royal Aberdeen Hospital for Sick Children at a cost of £100,000, is shortly to be started. The Lord Provost aims at raising £400,000—£300,000 for the erection of the new infirmary and £100,000 to increase the endowment fund.

Cadder.—EXTENSION.—A sale of work has been held in Cadder Parish Church in connection with the fund for extensions to the hall.

NEWS ITEMS

Northern Building Wages.

The application of the Northern Federation of Building Trades Operatives, which includes Lancashire, Cheshire, and North Wales, for an advance in wages from 20d. to 23d. per hour, which was referred to the National Joint Council, has been refused. The Council do not consider that the operatives have established a case for an advance and wages will consequently remain unchanged.

Cement Works, Port Elizabeth.

A communication has been received from the office of His Majesty's Trade Commissioner in South Africa calling attention to an announcement of the contemplated erection of cement works in the neighbourhood of Port Elizabeth. Firms interested in the supply of British cement plant that may be required in this connection can obtain further particulars regarding this matter on application to the Department of Overseas Trade, 35, Old Queen-street, London, S.W.1, quoting reference No. A.X.4494.

Woodworking Machinery Regulations.

In pursuance of section 79 of the Factory and Workshop Act, 1901, the Home Secretary makes the following regulation amending the Woodworking Machinery Regulations, 1922, made under the said section on November 2, 1922. "The definition of the words 'within reach' and the Regulation numbered (2) in the said Regulations are hereby revoked."

This regulation came into force on April 1, 1927, and may be cited as the Woodworking Machinery (Amendment) Regulation, 1927, and the Woodworking Machinery Regulations, 1922, as amended by this regulation, may be cited as the Woodworking Machinery Regulations. Copies of the Regulation may be obtained, price 1d., from H.M. Stationery Offices.

Wales—Glamorgan: Pontypridd U.D.C.

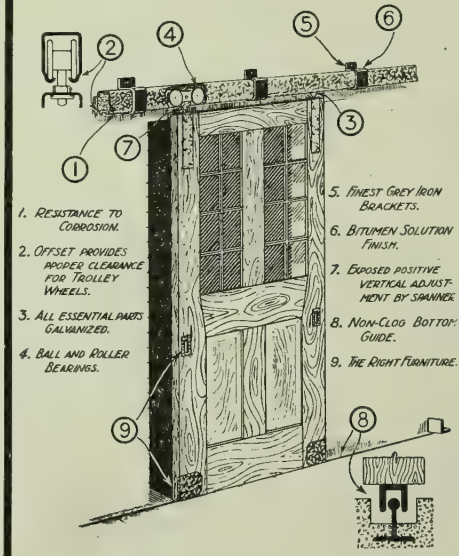
Bristol Apprenticeship Report.

The annual report of the Bristol Building Trades Joint Standing Apprenticeship Committee shows that during the past year 55 apprentices have been indentured to the following trades:—Bricklayers, 10; carpenters, 19; masons, 8; painters, 3; plasterers, 3; plumbers, 8; wood machinists, 4. It was estimated that about 60 apprentices would be required each year to maintain the present supply, and this figure had been nearly reached. That this year's number showed a decrease on last year's total was mainly accounted for by the fact that vacancies rarely occurred now except when an apprentice completed his term. During the year 38 such cases had occurred, and all except three of the apprentices had received extremely favourable reports from their employers, and were well satisfied with the training they had received. The attendance of apprentices at the Merchant Venturers' College building classes had been encouraged, and excellent results had been secured. The report calls the attention of employers to the Junior Technical School, to which they are invited to send their apprentices one day a week.

The Committee has now been in existence for eight years, and 82 firms have taken apprentices under the Committee's scheme, which has worked smoothly and been fully justified by the results. For all branches of the trade the applications outnumber the vacancies.

Cost of Houses: the Effect of the Subsidy.



Mr. Chamberlain, Minister of Health, recently visited Wandsworth to "take over" the one thousandth house built by the Housing Committee of Wandsworth Borough Council, and afterwards unveiled a pylon, the gift of the Mayor, to mark the completion of that house. Speaking at a reception at the Town Hall, he said that when he looked back over the last eight years he was astonished at the prodigious efforts the country had made to deal with one of the most baffling and difficult problems which which it had ever been faced. In England and Wales they had succeeded in erecting 863,000 houses, a figure which was certainly well in advance of the need for providing for increase of population. It was an interesting fact that out of that large number of houses no fewer than 558,000 had been provided by private enterprise, and upwards of 90 per cent of them were houses of a size generally considered suitable for people of the working classes. One thing that caused him concern to-day was that houses were costing too much. There had been certain increases in the cost of materials and the cost of labour, but when those were put together they did not account for the increase in the cost at which houses could be contracted for. He had come to the conclusion that one of the factors that had brought about the increase in the price of houses was the fact of the subsidy itself. He hoped the time would come when a still further reduction might be made in the subsidy in order to give further relief to the taxpayer.

Glazing Bars.

We give herewith an illustration of the " Parkes" glazing bar, made by Messrs. Sa Parkes & Co., Ltd., of Pretoria Works, Wil hall. The illustration shows clearly how is keyed into the bar, and also the channel for condensation. The glass is not liable fracture through unequal contraction expansion, vibration and concussion, as

wood and lead are in contact with it. This combines all the advantages of metal gla with the lesser weight and adaptability wood bar, and is especially suitable for rail stations, foundries, factories, chemical wo &c., where steam or fumes will corrode iron b The makers' latest circular, in which full ticulars are set out, will be sent upon reques

Asbestos Shares.

The directors of Messrs. Bell's Un Asbestos Co., Ltd., have submitted their re and audited accounts for the year en December 31, 1926, in which is recommen the payment of a dividend on the ordi shares of 2s. per share, which with the inte dividend paid on October 18 last makes a t distribution of 12½ per cent. for the year. final dividend is payable on April 11.

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

CXXXII.—No. 4393. APRIL 15, 1927.

REGISTRATION IN PARLIAMENT

AFTER a debate lasting nearly five hours, Parliament gave a second reading on Friday last to the Bill for the Registration of Architects introduced by the Royal Institute of British Architects. This bald statement, though quite accurate as far as it goes, does not ate the actual result of the debate and would be understood nyone who had not listened to the many speeches—good and indifferent—made by those who took part in the ssion, as approval of the Bill by Parliament and as a success s promoters; but while the R.I.B.A. can be congratulated the fact that their Bill has passed the second reading stage, e afraid they and the larger body of architectural opinion ghout the country in favour of its principles will be dis-nted when they know that, though the measure got gh the ordeal of a second reading and was referred to ect Committee of the House, this result followed a highly l debate which clearly showed that the Bill will need to go important modifications before it becomes an Act. romoters of the Bill appeared to realise this, for at a late of the debate they offered to delete clause 12, relating to ecovery of charges and to recast clause 11, so as to meet ews of civil engineers; and it was due to this offer and the gness of the promoters to refer the Bill to a Select Com-e that a second reading without a division was given to it. e 12 prescribes that a person shall not be entitled to recover harge in a court of law for professional services rendered architect unless he is a registered person, and this clause ause 11 (use of title) would have given registered architects, was thought, some protection from those unqualified for ration and made the Bill acceptable to those who, though new that architectural and building work would still be l out by unregistered persons, provided they did not call elves architects, yet realised that Parliament would not be to agree to more protection, even for the trained and ed architect. The justification of this belief was shown early period of the debate, and though there was support pposition for the principle of the Bill in about equal re, the opposition was chiefly directed to those two s. Clause 12, relating to the recovery of charges, is an ant part of the Bill judged from the standpoint of the registrationist, but it was not vital, and though it is dropped, there may still be enough in the Bill to justify orts which have been made by and on behalf of those who Parliamentary protection against the unqualified prac-rs, always provided that clause 11 remains, or is not ed too much. We know it is to be "recast," so as to he views of engineers, but how far will, we imagine, be er of considerable anxiety to those who hoped to obtain Registration Act at least the exclusive right to the use lified architects of the words "architect" and "archi-," for without that exclusive use it may well be asked left in the Bill to satisfy registrationists? Some indica-what Parliament may be willing to do in this direction ovided in the course of the debate. Captain Wallace, g on behalf of the promoters of the Bill, said they did h to tie themselves down to the use of the word "regis-but they were willing to consider the use of some ing word, and the Home Secretary, who made, in our nt, the best speech of the day, said he thought the sugges-at the expression "registered architect" should be used rth the consideration of the promoters of the Bill. We of course, know what qualifying word will be used, but er it be, if unregistered persons would still be free to use rds "architect" and "architecture," we are unable what value the Bill will be to those who have conscien-believed that many of the grievances of the competent practising architect would be removed by an Act for compulsory registration.

It is not without interest that the suggestion to use some qualifying word in clause 11, and especially "registered," should have been made by Professor Pite in a letter to *The Times* on the morning of the debate, in which he said that "the description of those practitioners who may elect to take advantage of the monopoly to be created should be 'registered architects.' This definition of the new genus will meet the main objection that the Bill ignores the genius of architecture; it will afford the protection that struggling architects petition as against competitors, and hall-mark them for the benefit of an innocent and inartistic public. Will the promoters, therefore, kindly add definitions of the key-words 'architect' and 'architecture' to their Bill? Or will they, alternatively, accept 'registered architect' as the legal title of its subjects? If they cannot do one or the other, we must trust the instinct of Parliament to protect the general freedom of architecture against this monopolistic limitation."

We have already considered Professor Pite's doubts in a recent issue, when we said that we respect the opinions of those who, like him, write in the interests of architecture as an art, but though we do not by any means identify ourselves with all the beliefs of the promoters of registration, and do not necessarily tie ourselves to the opinion that the principle of registration is a definitely wise one, we fear we must be classed with those who do not appreciate the implications upon the status of the art to which he refers. And though the Home Secretary stated in the debate that he was "a bit inclined to the idea that they might in the future cramp the artistic side of architecture"—presumably by examination and registration—he told us what appears to be forgotten in discussions on this very difficult question, *i.e.*, that the architectural profession has two sides—a scientific side and an artistic side. "On the former side, including questions of stresses and the like, it was in the highest degree desirable that architects should have the fullest education and that there should be an examination and probably a register of all men who were going to undertake the scientific side of architecture." We think there is much to be said for this point of view, irrespective of the Bill and its clauses, and in considering the question impartially and in the light of our knowledge and experience, we cannot understand the fears of those who think that the training for a qualifying examination will hinder the play of inspiration of any architectural genius. As things are to-day the Associateship of the R.I.B.A. can be passed at the early age of 21, and even if the training for such an examination had a cramping effect on an architectural genius, what is there to hinder him subsequently breaking right away from any cramping influence there may have been and giving his inspiration full play? Most architects get their opportunities long after this age, and in some exceptional cases where exceptional success has been gained quite early in life we know how ideas have altered in the execution of work. We fail to see, therefore, why the artistic side of architecture need be cramped by training and examination.

Much might be said about the debate itself, but as we give elsewhere an impression by an architectural critic and a report of the speeches, we need only remark that the lengthy consideration that was given to the Bill was due, we understand, to a desire to prevent discussion on another Bill. Never before, probably, have the Institute or architects received so much publicity in Parliament at one time, and though that is all to the good, we wonder whether there will be any other gain or any advantage commensurate with the great efforts the R.I.B.A. have honourably made in the attempt to carry out the wishes of the majority of its members.

NOTES

Impartial Criticism. We have received a letter from a correspondent who calls himself an impartial critic, but who also has the grace to add that he is perhaps unqualified. He says the architects' and sculptors' profession exists to erect some kind of obstruction or other, and therefore why not let off the plateau in front of St. George's Hall, at Liverpool, as a monumental mason or stonemason's yard, with the proviso that anything obstructing the passage of His Majesty's judges at the Assizes be removed immediately and notice be given that the Courts are to be held. Does it really please our correspondent to suppose that in their roll of obstructionists architects and sculptors would enjoy this privilege and might be allowed to exercise it, or is this suggestion a piece of grim irony? Would he allow that a sincere desire to give a place of signal honour to the proposed cenotaph suggested its proposed site and that an equally sincere desire to find a distinguished and worthy site in a place which would not disturb the dignified effect of the plateau was also the reason for the objections raised to its suggested site? It is certainly well to be fair—and impartial.

The Registration Bill. A correspondent writes: "In spite of the hopes entertained by the framers of this Bill it cannot be said the discussion in Parliament revealed much in the way of whole-hearted support, and it appears to me that a far more general approval is required before it can hope to become law. The decision to refer the Bill to a Select Committee is, perhaps, but the stage before its final demise. Yet the aim was well intended, for the need of a more appreciative and trained practise in building is much to be desired, though we should not forget that improvement is quite evident at the present time. It was, perhaps, this feeling which led to such support as was forthcoming to a measure which many feel to be a threat to the freedom of architecture. Not for the first time have well-intended attempts been made to find short cuts to improvement in the arts, through legislation, yet it does not lie this way. To close a profession, which is also an art, is to forget the latter for the former. Architecture tied to authority through registration would, I fear, result in the shifting of genius in favour of the conformist, whose more pliable and adaptable nature would benefit at his cost, and the cost of the art of architecture.

The Control of Architecture. Much attention has been given by Mr. Neville Chamberlain and by many architects who are keenly interested in the preservation of our architectural treasures, to the well-known clause inserted in the Bath Corporation Act of 1925. This Act gives the Council control over new buildings, or alterations to old buildings, in their town, and in case of dispute an appeal can be made to an independent advisory committee, consisting of an architect to be selected by the Royal Institute of British Architects, a surveyor to be selected by the Surveyors' Institution, and a magistrat a member of the Council) as cha This clause has been imitated at burgh, and the Ministry of Healt known to be interested in this exper to effect control over buildings. Pr however, is slow. No steps have ye taken to invite the professional named in the Act to nominate representatives, and indeed there purpose in such a Committee formed until new by-laws have framed and approved. One aspect work of this Committee has up t present escaped notice, and shou watched by the architects who adv such a clause in the belief that it tend to a raising of the standa architectural design. The Bath mittee is only a body to which can be made in case of a dispute be the Council and a building owner. however, not likely to be called advise in the case of buildings erect the Council themselves. What pow influence, we wonder, can the Comm wherever it is appointed, exercise municipal buildings?

New Village, Port Meirion.

Mr. Clough Williams-Ellis, Architect.

Versailles. Just as in Great Brita have our problem i preservation of the H of Parliament, so the French are h considerable anxiety regarding the of Versailles. There was a serious c that the noted Galerie des Glac Versailles would have been irretri damaged by wind and weather ow the bad condition of the roof, f stone work and marble had r deteriorated. Even the little thea Marie Antoinette was decaying timely gift amounting to eleven m francs, or nearly £100,000, present the Rockefeller Donation, has e the necessary preservation work taken in hand. The State is also b its share and has furnished near million francs towards the cost work, which is almost completed. tion is now being given to improvi precautions taken in case of fire bath-room of Louis XIV has now converted into a first-aid station.

Control of Buildings at Stratford-on-Avon. The Corporation of ford-on-Avon are co ing means to existing buildings a formulate powers so control the height, colour, materi size of future buildings. In th Stratford has been somewhat care its architectural treasures, and a seventeenth century work to be des It is felt, however, that in such a t is essential that the greatest care be taken that all new buildings harmonise with their old-world su ings. In this connection special at is being given to the following that gave the Council at Ruislip th to pass judgment on the archit styles of any new building worl

ion for arbitration in case of dispute.
e 56 in the Ruislip-Northwood Town
ing Scheme reads as follows :—

If, having regard to the nature and
ation of the site of any building or
dings proposed to be erected or
red or to the character of any
dings erected or in course of erection
he neighbourhood of such site, the
ncil are of opinion that the character
he building or buildings proposed
be erected or altered would be
rious to the amenity of the neigh-
rhood, whether on account of the
gn or the undue repetition of the
gn or the materials to be used, the
ncil may require such reasonable
rations to be made in regard to the
gn and materials as they think fit
require the plans to be amended
ordingly."

e of the problems is the constitution
Tribunal to whom appeals may be
At Ruislip, a single arbitrator
e appointed by the President of the
Institute of British Architects. It
gested that at Stratford the Ad-
Committee, who would advise on
te questions of architectural design,
include a representative of the
ration, certain persons of eminent
city in architecture, painting or
ure, and of the trustees of Shakes-
s birthplace.

ehold lation.

At the present moment it is impossible to give any detailed criticism of the Bill to amend the law of olds which is entitled "The Land- nd Tenant Bill." From the sum- which has appeared in the Press, ll gives compensation for improve- and for goodwill in certain circum- s, and much depends upon the wording of the clauses in connection these questions. The most con- us portion of the Bill appears to be hich gives a tenant the right to a ase in certain cases, and here we ve the taint of Rent Restriction. ne thing to give compensation for ements and goodwill, but entirely rent thing to interfere with the of the owner of property to select om he shall let it. The Rent Acts one incalculable damage to housing ise in this country, and with such ive restrictions attached, real pro- becomes a *damnosa hereditas*. It ped that when at length the Rent ere repealed, this kind of restrictive ion, the source of endless litigation, disappear for good, but thirteen f Rent Restriction appear to have even a Conservative Government sight of the primary principle of and *tuum*, and *tuum* is given a tatutory right in the property of and can drag the owner of pro- before a tribunal to enquire into s the property is to be put to by ttful owner. We have no wish to ge this Bill on an imperfect examination of its clauses, but this particular clause appears to perpetuate the restrictive provisions foreign to our law of property and only introduced in the Rent Acts to meet a special war emergency.

The New Tower of Babel": A Set from the film "Metropolis."

Memorial to Queen Alexandra.

The decision of the Committee for this memorial to accept in a modified form the design submitted by Mr. Alfred Gilbert is a welcome sign that he is again working among us, after his long absence from England, and is to be occupied on so important an undertaking. The memorial is to be erected on a site next to Marlborough House and facing Friary Court. The garden wall will be recessed, and a group in bronze erected, typifying Faith, Hope and Charity, which, in the hands of this accomplished sculptor, we may expect to be of intimate and charming character.

The Late Fred Morgan.

Fred Morgan, who has just died, was one of the happiest exponents of child life, and for many years we have found much pleasure in his works. That the value of individuality always counts was shown by the fact that amongst the many succe sful illustrations of children, Fred Morgan's work maintained a distinctive charm.

A New Welsh Village.

A new Welsh coast village is now being designed by Mr. Clough Williams Ellis, who was the architect of the First Church of Christ Scientist at Belfast. He has cleverly converted an old house at Port Meirion, in Merioneth, North Wales, and the colony around is being developed after the fashion of a walled Italian hill village. No plans are approved unless they are not only architecturally irreproachable in themselves, but also contribute to the whole scheme. Visitors this Easter will look over an almost land-locked bay, close by a reputed smugglers' cabin, with daffodils all around. Above are the snow-covered mountain peaks of Snowdon and Cader Idris.

Architecture on the Screen

We have recently had the opportunity of viewing at a West End theatre a film, "Metropolis," which attempts, very ingeniously it must be admitted, to deal with the problems of existence one hundred years hence. The film is a triumph of production, acting and photography, which in some part recompense for the weakness of the story. There are, however, some "shots" of the conjectured architecture of a century ahead, which are of an interesting character since they at least show us what we must hope to avoid. We reproduce an example of such architecture on this page, the central building being the new "Tower of Babel," from which the activities of the whole industrial city—built underground—are controlled. This building, it has to be admitted, possesses a certain stark grandeur, but is of a type that we can well do without, both now and, we will hope, in the future. There are several other "shots" of architectural interest, including one of what is called "The Stadium of the Sons of the Rich," displaying a pleasant treatment of walls.

GENERAL NEWS

Professional Announcement.

Messrs. Hodgson, Lunn & Co., chartered architects, have removed to a new address, Somerset Hall, 201, High-street, Guildford. Telephone: Guildford 276.

Mr. Ambrose McEvoy's Estate.

Mr. Arthur Ambrose McEvoy, A.R.A., of Grosvenor-road, Westminster, left £9,442, net personalty £7,265.

Leicester City Football Club.

Leicester City Football Club have decided to spend between £30,000 and £40,000 on improvement to their ground before next season. The total accommodation will be for at least 50,000 spectators and will include seating accommodation for about 12,000.

Northern Ireland Research Station.

Mr. E. M. Archdale, Minister for Agriculture, explained recently to the Parliament of Northern Ireland the details of the Agricultural Research Station Bill, which provides for the establishment of such a station at Hillsborough. The Government, he said, proposed to provide a capital sum of £30,000 for the erection of new and the re-conditioning of existing buildings, as well as for stocking and equipping the station.

Alloway Kirk.

The Ancient Monuments Advisory Board for Scotland have decided that Alloway Kirk should be scheduled as an ancient monument owing to the association of the building with Burns' "Tam o' Shanter." On this account only was the building recommended for scheduling, as it was considered to be of no architectural, archæological, or historical interest of national importance.

Plymouth Central Park.

The sub-committee of the Plymouth County Borough have considered the report of the Borough Surveyor with regard to the appointment of a landscape architect, and have recommended that Mr. T. H. Mawson, of the firm of Messrs. T. H. Mawson & Son, of Westminster, be requested to meet the sub-committee with regard to his suggested appointment as consulting landscape architect in connection with the proposed lay-out of the Central Park.

Sakkara Excavations.

It is understood that Mr. Cecil Firth is continuing his excavations from the series of underground chambers already discovered at Sakkara, and has succeeded in clearing a zig-zag passage about 50 ft. long leading to two doors, from which it appears that further steps lead downwards. During the process of excavation large blocks of alabaster and diarite have been found, which seem to indicate that the unexplored chambers contain something of interest.

Memorial to Queen Alexandra.

The Committee appointed by H.M. the King for the consideration of the provision of a personal memorial to Queen Alexandra, with the approval of His Majesty, have decided to accept, in a modified form, a design submitted to them by Mr. Alfred Gilbert for a memorial to be erected on a site adjacent to Marlborough House and facing Friary Court. A portion of the garden wall will be recessed, and a group in bronze will be erected typifying Faith, Hope, and Charity, as virtues closely identified with the late Queen.

New Thames Bridge at Molesey.

Alternative schemes submitted by the Surrey County Council for the proposed new main road bridge across the Thames between Molesey and Hampton Court were mentioned in a report placed before the Thames Conservancy at their meeting in London on Monday. The scheme which received most support was that for a bridge beginning at the junction of the Mole with the Thames and crossing the latter at a point close to the northern abutment of the existing bridge. It would have three arches, each with a 95 ft. span, and the abutments and piers would be practically parallel to the stream. The report was agreed to.

British Embassy at Washington.

Building tenders will shortly be invited for the proposed new British Embassy, which is expected to be one of the finest structures of its kind in the world. Latest details to hand show that the building, which we illustrated in *The Builder* for March 18, will cost about $700,000 (£140,000). Brick and Indiana freestone will be the material. There will be two "L"-shaped wings, to be used by the Chancery. The main part of the building will contain reception halls and parlours specially designed for official functions and social purposes. The Ambassador's offices will be in the main building. The second floor will contain the Ambassador's residential quarters.

The Telford Bridge, Tongland.

At the quarterly meeting of the Southern District Committee of the Stewartry County Council, Mr. R. Gibson, road surveyor, submitted a report on the Telford Bridge over the Dee at Tongland, near Kirkcudbright. The bridge was built in the early years of the nineteenth century. Mr. Gibson, in his report, stated that in so far as the main structure was concerned, it had successfully resisted the vicissitudes of time and tide. In the intervening spaces between the spandrel walls were freestone flags 9 in. thick. These flags now constituted the weak links in the chain of communication across the river, and as a result of a recent survey, close upon a hundred flags were found to present more or less serious defects. Although he did not anticipate immediate danger, he considered that no time should be lost in effecting the necessary works of repair.

London Garden Squares.

The Parks Committee and the Town-planning Committee of the L.C.C. recommend that the Council should ask the Government to set up an inquiry into "the public and private rights and duties" relating to the garden squares, with a view to preparing legislation to protect them.

The joint report of these committees states that there are in London 297 garden squares and 128 enclosures, and that only 64 have been scheduled by agreement under the Act of 1906. An investigation on behalf of the Council has already been undertaken as to the history of each square or group of squares, statutory enactments affecting them, the effect on them of judicial decisions, rights, or benefits enjoyed by persons other than the owners of the squares, and the views of the owners as to the preservation of the squares.

The report adds: "The survey, which has been in progress for some considerable time, is now nearing completion, 135 squares and gardens having been examined. In 53 cases the squares and gardens appear to be protected by the Edwardes-square judgment. In 11 cases the judgment gives no protection. In 15 other cases the present conditions afford protection from building. In a large number of cases, however, the information obtained is insufficient to enable a definite opinion to be expressed.

"In the absence of complete particulars, we feel that it is not possible for the Council to decide on a definite line of action as to the means to be taken to preserve London squares. It appears to us that comparatively little can be hoped for from procedure by private Bill with incomplete information, and that any Bill would have little prospect of success without the support of the Government. Much of the necessary information would be forthcoming only by the attendance of witnesses and the production of documents at a tribunal of inquiry. We are convinced, therefore, that a Government inquiry would afford the only satisfactory means of dealing with the matter."

Lincoln Cathedral Discoveries.

Some interesting discoveries have recently been made in the course of repair work at the west end of the nave in Lincoln Cathedral. In replastering the vaulting traces of painted decoration were discovered (according to the *Morning Post*) on the old plaster as wel names, which are supposed to be those o men who were engaged on the buildin nave, or of artists who carved the bosse vaulting, as both names are close to The names are Fricabon and Braud, a have been restored, and are now plainly ible from the floor of the cathedral. discovery was that the piers of the nav were originally connected at the leve capitals by massive oak beams, joining east and west and north and south, an the aisle walls, at the level of the These beams were apparently put strengthen the arcade while the upper pa nave was being built. They ran thro masonry in each direction, and when n needed were sawn off flush with the sur ends left in being plastered over.

COMPETITION N

Cemetery Chapel, Reading.

The Corporation of Reading invite a residing or practising in Berkshire, Buck shire or Oxfordshire to submit con designs for a chapel which it is proposed in a new cemetery. Premiums: F guineas; second, 25 guineas. Particul be obtained on application (after May 1 Borough Surveyor, Town Hall, Read deposit of £2 2s. Mr. Charles J. B F.R.I.B.A., assessor, to whom designs, "Design for Chapel," are to be deli 13, Ashburn-gardens, London, S.W.7, n than July 1.

Municipal Technical College and Schoo Rotherham.

Architects are invited to submit de a proposed new Municipal Technical Co School of Art at Rotherham. Pre First, £200; second, £100; third, £ fessor S. D. Adshead assessor. Applic particulars must be sent not later than to Mr. J. A. Mair, Secretary for E Education Offices, Rotherham. Deposit required. (Cheques to be made pa Borough Treasurer.)

Municipal Offices, Beckenham.

Beckenham U.D.C. invite architects t designs and preliminary sketches for new Municipal Offices. A limited nu such preliminary designs will be select assessor, Mr. Septimus Warwick, F. and their authors will be invited to tak a final competition. A premium of £1(paid to each competitor in the final com Application for the conditions should before April 27 to the Surveyor, Counc Beckenham.

Ramsgate Harbour Station S

In connection with the disposal for t of the old Ramsgate Harbour Statio recommendation has been made by Committee that the Town Council sho competitive designs for the lay-out and ment of the site, and that prizes of £ and £100 should be offered for the t designs. Consideration of the sugge been deferred in order that the memb Council shall have an opportunity in c of expressing their views on the subj

Wimbledon Municipal Building

We are informed that the Wimble have appointed Mr. H. V. Ashley, F. in place of Mr. Austen Hall, F.R.I.B.A., as assessor in connection with the co for the proposed new municipal buildi

Bradford Grammar School.

We have received from the promot of questions and answers relating to petition, from which we note that for sending in designs has been exten May 31 to June 30.

The Canal from the Garden House, Melchet Court.

Messrs. Darcy Braddell & Humphrey Deane, Architects.

THE PLANNING OF EAST KENT.

Mr. Arthur Keen, V.-P.R.I.B.A., was in the chair at the R.I.B.A., 9, Conduit-street, on Monday, when Professor Patrick Abercrombie, M.A., read a paper on this subject.

Introducing his subject, the lecturer said that East Kent presented perhaps two unusual and interesting features among the numerous developments that were taking place. In the first place a rural area of great beauty in the home counties was suddenly changing its character to fit it for a function that so far was reserved for places in the north and midlands; secondly, that owing to the suddenness of this change, it was possible to observe simultaneously the three-fold stages of development: regional survey and planning; town planning; town building.

Sharpness of contrast was thus emphasised by rapidity of change. It was probably due to those special circumstances that the Archbishop of Canterbury summoned a conference, the outcome of which was the appointment of a special Advisory Committee, on which could be represented the general public, the Ministry of Health, the local authorities, industrialists, labour, and the local residents. The formative work of that Committee was carried out under the late Lord Milner, who brought to bear his vast and varied experience on a problem of concentrated local importance. Since his death, Mr. H. E. H. Rice had succeeded him as chairman, and the hon. secretaryship had been in the hands of Mr. G. L. Pepler. The notes on East Kent might be conveniently divided into four parts: (1) Regional survey; (2) regional proposals; (3) town planning; (4) town and village building.

Dealing with the survey, the lecturer said the report of preliminary survey intended to explore the ground from every point of view had already been published by the Regional Committee, representing the seventeen local authorities concerned. It indicated the dual aspect of the problem, the preservation of the existing character of the region and the features which would govern the new developments. The aspects of preservation might be summarised as follows:—In the first place, there was what might be termed the present industry of East Kent, in the form of a series of seaside towns which fringed the coast from Whitstable to Folkestone. There were next the historical features, including the towns of Canterbury, Sandwich and Dover, and a series of typical old villages of which Wickhambreux and Barfreston might be singled out. In addition, there were the purely archæological remains rising to monumental grandeur at Richborough, Reculver and Dover.

Dealing with the commercial side of it, the lecturer said they were chiefly interested in three groups that were working, or hoped to work, four pits. On the northern extremity of the field was Chislet, belonging to a company which had some connection with the Powell Duffryn Company of South Wales; in the middle, Snowdown and Betteshanger belonged to Messrs. Pearson & Dorman Long, Ltd.; and a little farther south, Tilmanstone, with which was associated the name of Mr. Tilden Smith. The richest thicknesses of coal, which appeared in the southern area, for various reasons were at present lying dormant.

Dealing with communications, the lecturer said that the existing communications had naturally followed the coastal development. The two principal streams of traffic were the London-Thanet route, via Canterbury, and the London-Folkestone-Dover. There was also the famous Roman road from Canterbury to Dover, and a further well-marked line of traffic from Thanet to Deal and Dover through Sandwich. There were, however, too many local ways, unenclosed by hedges, which presented a real problem from the point of view of upkeep.

The lecturer then dealt with the regional plan, which, he said, was still in course of preparation. Certain broad features had been agreed upon, and development was proceeding in accordance with them. A final zoning plan had not been produced as yet, but an important industrial zone was to be delineated, of which each coalpit would form a centre of a circle of ½-mile radius. Within that circle no houses except a limited number required for pit needs were to be allowed. There would, of course, be other industrial areas of a more normal character in addition to those. The proposed new residential areas had also been to a large extent settled. The idea was to group several pits together, wherever possible, and to concentrate this new residential growth into a few large new towns rather than to scatter it in single houses or individual housing schemes. It was estimated that there would be eight of those new towns, and possible sites were indicated on the tentative zoning plan. Account had been taken of the ancillary population that would probably follow in the wake of coal-mining and iron-working; decentralisation of many industries from London to acquire cheap land, fuel, and accessibility to Continental markets would occur.

Industrial transport in East Kent would become of the greatest importance. There were in existence the Southern Railway and the East Kent Light Railway, and in addition there had been suggestions made for aerial rope railways, while there was a quite feasible project of a reopening of the ancient River Wantsum by means of a canal to connect the River Stone with the Thames Estuary somewhere near Birchington.

Dealing with architectural control, the lecturer said that in addition to determining where buildings should go it was essential to obtain some control of their design and materials. Outrageous design had been inflicted upon East Kent of recent years, quite apart from industrial changes, by local authorities; on the other hand, other authorities had realised their æsthetic duties, and he (the lecturer) would specially mention the Southern Railway, which had recently erected some fine stations, notably those at Ramsgate and Margate. But there was the control of individual building design to be taken in hand, and that could now be effected by the inclusion of the recently-drafted model clause in town-planning schemes.

Speaking of the Regional Realisations by Town-Planning Schemes, the lecturer said that several local authorities were preparing for, or had reached, the preliminary statement for a town-planning scheme. It had been suggested that several town-planning camps might be formed, grouped as Thanet: Canterbury with Whitstable, Herne Bay, Blean, and part of Bridge; Sandwich with Eastry, Deal and Walmer; Dover with Folkestone, Dover Rural and part of Elham. Those groupings would be practicable for preparation and administration of schemes, but they would fail in securing unified financial responsibility. Rural districts as Eastry and parts of Bridge and Dover Rural, to which colliery development was practically confined, needed the support of Thanet and other coast if they were to prepare schemes boldness.

Speaking of the new towns, the said that four sites had recently been being developed: at Chislet, under veillance of Mr. G. J. Skipper, of Aylesham (for Snowdown Pit), with Abercrombie in association with Messrs Archibald and C. F. J. Martindale; (for Tilmanstone), with Professor crombie and Mr. Archibald; and Little ham, with Professor Abercrombie Martindale.

Chislet was designed for 1,000 ho lay along the Thanet-road and would centre planned with axis at right a traffic route; a village green was to be from the frontage and treated in fashion, with church, rectory, institut and inn surrounding. There was a b starting at right angles to the road and round so as to run roughly paralle along that would be placed chapel, and it would lead across to the r ground and through a wood. Sevent were at present occupied, and a fur were to be added.

Aylesham was designed for more pit and sited according to the tentativ plan. The site was a superb one plan had endeavoured to make use shape of the site for its very simple main broad avenue along the botto fold starting from the railway, with ping square halfway up where the ro the pits, north and south, cross t axis; farther up the avenue was st the site of a church which would be against the drop scene of the beech Other sites for churches and schools reserved at focal points. The site as would take 2,000 houses, but could be to hold a further 1,000, or an ultima lation of 15,000. The planning of th presented no unusual or adventurous and half were being built in brick in steel, with external face of pou crete, Messrs. Dorman Long's specia construction. The necessary contras unemphatic houses would be provide public buildings. The town would tremely well provided with open spa being over 300 acres of playin Elvington originally was a group built during the early days of the near Tilmanstone pit. At present 1 were being built to fill in gaps in e out. Pixhill, the fourth new to located near Little Mongeham ar have a fine prospect from a hillside.

In conclusion, said the lecturer, be interesting in two years' time to Kent; it was to be hoped that by was being raised, houses lived in, of the wounds we were at this m flicting upon the garden of Engla have healed.

Discussion.

Mr. G. L. Pepler, Chief Town P the Ministry of Health, in proposi of thanks to the lecturer, said that had put his heart into his job. was of a kind that was difficult estimate. East Kent was a key England. Its shores were fringed w towns; while its bricks, flowers ar were famed. Suddenly they had to for the industries of coal-getting making. There was an entirely ne tion to be housed and supplied amenities of life. East Kent was England that had jogged along for but it had, at any rate, a clean they could start without the dis other districts had. Few men ha opportunity of doing a public servi as this, and as far as Professor A was concerned, it was a question o man in the right place. He (th felt that with the help of Profe crombie and the weight of public o scheme would go forward to a succ clusion.

EL F. J. BYRNE, C.M.G., in seconding
e, said that, speaking for Messrs.
& Dorman Long, he would like it
that the latter were up against some-
There were seventeen various local
ies, and it was not easy to satisfy
ll. He felt that the first principle,
eir point of view, was economic. But
did not sink a pit where there was a
nning scheme they could not sink it
He felt, however, that Aylesham would
edit to Kent, but that when it came
ssue of economics the colliery owners
ot undertake to do everything that
uired of them.

EL H. F. COBB, in supporting the vote
s, said he had been interested in Kent
ife, and especially lately. He hesitated
ise, but he felt that the scheme was
t had conditions been normal. It was
to get the ideal plan with present
c conditions.

SSOR S. D. ADSHEAD, supporting,
at he could not quite agree that the
would not be spoilt. He did not
er agree with the scheme Professor
mbie had propounded. He (the
) suggested villages within walking
e of the pits and, say, two instead of five townships—right away from the pits. There was one other point, the ancillary industries. They might look forward to the time when coal would be treated, and they would have industrial towns with their appalling characteristics. One or two villages could not handle all that would be required.

MR. SKIPPER, of Norwich, thanked Professor Abercrombie for his paper.

LIEUT.-COLONEL G. REAVELL said that if they had the villages too far from the pits, one would find what was called "Ribbon" development going on along the road to the town.

MR. R. BRUCE said that he had been associated with other colliery districts of England, and he hoped that East Kent would never become like Lancashire. He felt that the local authorities would recognise the economic needs when regulating the sinking of pits.

THE CHAIRMAN said that the problem we were up against was that one of the most delightful parts of England was going to be turned into an industrial district. The only thing for congratulation was that its development was in such able hands.

PROFESSOR ABERCROMBIE then replied briefly, and proceedings terminated.

HE REGISTRATION BILL DEBATE

AN IMPRESSION.

BY OBSERVER.

Editor of *The Builder* has asked me
some account of the impression that
iday's debate made on a spectator who
particular bias in the most contro-
matter that the architectural profes-
s had to deal with for many years.
something of an achievement that
tural politics occupied the time of
use of Commons, and the earnest
n of a few of its members, for close
hours; and on the whole the debate
ther less futile than one might have
d. It became clear that though many
e concerned were not very well in-
about the functions of an architect,
t others had no respect for him under
me or in any circumstances, the feel-
the House in regard to registration
irly sensible.

manners of Parliament have not
l in twenty years, and one felt sorry
worthy baronet who had to introduce
gistration Bill in a speech that was
ally interrupted, and very rudely and
interrupted, by his right honourable
opposite. He was in full blast when
ed my seat about 11.10, and he spoke
minutes. He said all the things that
ected him to say, and nothing that
nexpected, but he left open a good
oopholes of attack for his opponents.
chitect was represented as a suffering
el who alone has it in his power to
ral England from the uglification that
her in these wicked days. Register
d all will be well. Moreover, the pre-
ll was so tolerant of the interests of
besides architects that nobody need
or feel aggrieved, and, in fact, nearly
organisations that might be expected
t had already given it their support.
atement led to a sudden interruption
e speaker's neighbour, Lieut.-Colonel
tle, who denied that the Sanitary In-
-one of the bodies specifically men-
-was in favour of the Bill; and later
me apparent that other vested interests
the warpath. But it was claimed
erybody who is now designing houses
training or qualification of any sort
be protected by the Bill, a somewhat
g announcement that was eagerly
d on by later speakers. The remark
ls is one of the few countries where
ts are allowed to practise without
y authority was greeted with a sten-torian "Hear, hear" from across the House. Another voice from the blue interjected a remark about Wren, implying that Sir Christopher would never have attained the status of a "registered architect," entering the profession as he did from the unorthodox position of a professor at Oxford. In fact, Wren came in for mention on several subsequent occasions during the debate, but eventually it seemed to be accepted that in such an emergency the R.I.B.A. would have elected him a Fellow, possibly from the Licentiate class! Or he might have passed the special examination open to architects in practice, having attained the age of 25 years; who knows? Fortunately we were spared the usual absurd statements from critics of the architectural profession, that there were no architects in the Middle Ages.

The sponsor of the Bill having sat down after facing his tormentors for fifty minutes, was followed by Lieut.-Colonel Moore, who delivered a most persuasive speech in seconding the Bill, though it contained one indiscreet reference to more generous emoluments for aspiring young men.

The case against the Bill was opened by Mr. Alexander, Labour member for Hillsborough, in one of the best speeches of the debate, temperate and thoughtful. He objected to the increasing practice of forming close professional corporations, but his real points of criticism were two: that under the conditions set up by Registration the hitherto open avenue to the top of the profession would be closed to a poor boy, and that it would be impossible in the future for any corporate body—as, for example, the Co-operative Society that he represented—to employ an architect on a fixed salary. The latter point seemed to me to indicate a misunderstanding; surely the registration of architects will leave the position of the salaried men unchanged? As regards the first objection, a very serious objection if it were founded on fact, the "matriculation standard" that is to be insisted on by the R.I.B.A. in the near future in lieu of the probationary examination that was the test in my day, does, of course, present an obstacle to a youth who leaves an elementary school at 14, but it is possible nowadays for every clever boy to matriculate from a State secondary school, and the really difficult case is that of an artistic youth whose abilities do not run in the direction of passing matriculaton.

Then came Colonel Wedgwood with the most amusing speech of the day, entirely against the Bill and not at all flattering to architects. He said he had done building without an architect, that all the worst building was done without architects, and that the Bill would not in any way prevent people from pursuing these evil ways. As an ex-naval architect himself, he compared naval with terrestrial architecture, and said that his profession would scorn to ask for or accept State recognition. He also objected to a Bill that would make architects more scarce and therefore more expensive.

Sir Alfred Hopkinson, as a University member, blessed the Bill effusively up to a point, then suddenly reversed and said he would only support it on condition that Clauses 11 and 12, just those clauses which make registration at all attractive to the architect, were omitted. Thus he would not agree to a monopoly of the coveted title "architect," nor to the right to recover fees in a court of law which the Bill seeks to limit to those within the registered fold. Mr. Cowan, another University representative and a Liberal, supported the Bill, but the next speaker, Mr. Hills, was against it (especially against Clauses 11 and 12), dragged in Wren once more, and laid stress on the impossibility of testing and examining an artist. He also explained how in America the unregistered architects managed to dodge the regulations.

Then came a warm and intelligent defence of architects and their Bill from Mr. Gardner, the Labour member for Hammersmith. It was a feature of the debate that opinions were voiced quite regardless of party politics. This speech probably did a good deal to influence the House in support of the measure; whereas Major Tasker, himself trained as an architect, made so violent an attack on the Bill, and above all on the Institute of Architects, that he must have antagonised many who would otherwise have agreed with him. He made two or three good debating points, *e.g.*, that a large number of Fellows of the R.I.B.A. and all the Licentiates had never passed the examinations that they now sought to force on others, and that this Bill had been wangled through a meeting attended by 13 members out of 8,000 without a referendum to the profession. But his statement about Bentley's lack of architectural training may be refuted by reference to any standard biography, and his subsequent reading of a perfectly reasonable examination paper in architectural history did not help his arguments in the least.

Then came other speakers, some of whom approved the Bill because it was sheer trade unionism, others because it was not, and a distinguished engineer who opposed it because he insisted that civil engineers must continue to be allowed to design buildings. It seemed to me that the honours were about even when Captain Wallace was put up by the promoters of the Bill to give us the surprise of the debate. With the perfect manners of a diplomat he proceeded to hand out concessions so generously that my hair stood on end. They would omit Clause 12 and amend Clause 11; they would make things easy for the poor aspirant and the poor engineer; they would even modify their labels and titles. After him rose up "Jix," bland and brisk in a nice brown suit. He had thought of the very thing: give the Bill a second reading and then send it upstairs to be vivisected by a Select Committee. All the objectors could have their say. There were other speakers after this, but everybody seemed to be satisfied, the opponents of the Bill obviously feeling confident that the already mangled object that was to go upstairs could be fashioned still nearer to their hearts' desire.

So it was all over, and most of us left the House somewhat chastened. Registration, when it comes, will not be such a wonderful thing after all. For five hours I had listened to what the world says about architects; it was sufficiently interesting to make me miss my lunch without much regret; but it was an informing rather than an inspiring experience.

AMERICAN APARTMENT HOUSES.—XIV

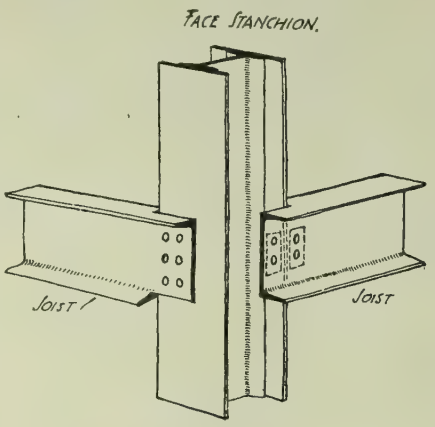
By F. E. BENNETT, A.R.I.B.A.

CONSTRUCTION.

This section gives some general notes on the building practice and mentions a few things which are, perhaps, peculiar to America. The present customs of construction are largely the outcome of the legal restrictions which were enacted in the first place to correct the evils of the old tenement house buildings. The law is designed to ensure that buildings of six to fifteen stories containing flats are well fireproofed. Above 150 ft. in height these buildings have to be eminently fireproof and practically no wood may be used in them.

Big contractors will not undertake jobs of a cost less than about £20,000. The general contractor may be one man who collects together all the sub-contractors and perhaps he will draw 10 per cent. for this off each sub-contractor's portion. The form of contract usually states: "Time is the essence of this contract." The builder makes "shop drawings" for all parts of the structure, which are examined and approved by the architect before being worked from in the builder's shop. Much fine work in a building has often to be simplified or standardised owing to the lack of advanced craftsmanship.

The tall building on a restricted site is a great task for a builder to handle, and, in addition, he is usually forced by the owner to build at maximum speed. He puts stairs and lifts in as soon as possible. Being part of the steel contractor's work they can go in as soon as the framework is erected. As much as possible of the work is assembled away from the job. Men on the job appear to work together well. There seem to be few petty differences among them and a considerable tolerance of one another exists. The contractor's "superintendent" on one job said: "Our bricklayers get £3 a day. We've got to work quickly. I try to get my bricks locally so as never to have men idle for want of supplies. We don't like an architect's superintendent on the job. They are too kid-gloved."



Another said: "The job will be completed in 15 months (a great 20-story block of offices). The pace is very wearing. We are working by night because there isn't enough room by day. The lifts are working the whole time at 700 ft. per minute. Getting a job through rapidly depends on two main factors:

"(1) Have the materials delivered at exactly the time they are wanted so that space is always clear. Owing to the smallness of sites and the enormous bulk of the building the progress of a job would be absolutely impossible without this arrangement. There is literally nowhere to dump stuff.

"(2) Efficiency and industry of labour are essential. Every pair of hands must be worked to its fullest capacity and that capacity must be of a high standard. The number of persons must be cut down to the lowest, not so much as a financial economy but to prevent congestion."

Foundations.—Most of the tall buildings in New York and Chicago stand on rock either directly or with intermediate piles which may have to go down 100 ft. Rock, however, is not necessarily the foundation. Concrete piles in soft ground supporting steel grillage are frequently employed. Caissons are not used so much as formerly. Pointed and capped steel cylinders filled with concrete and driven down with monkey, are considered to be much quicker.

Steel Framework is generally more slender than in England. For blocks of flats it is somewhat irregular, having been designed in the first place to suit the typical plan—a process the reverse from that in the planning of office buildings. Perhaps a central stanchion on the front wall is carried on to a girder at the ground floor to leave space for the entrance. The outer wall beams are not held squarely on the webs of the outer wall stanchions but are cut and bracketed to the faces of them so that they stand forward and support the brick walls (Fig. 47). The metal stairs are run up together with the framework.

Method of Carrying Wall Joists.

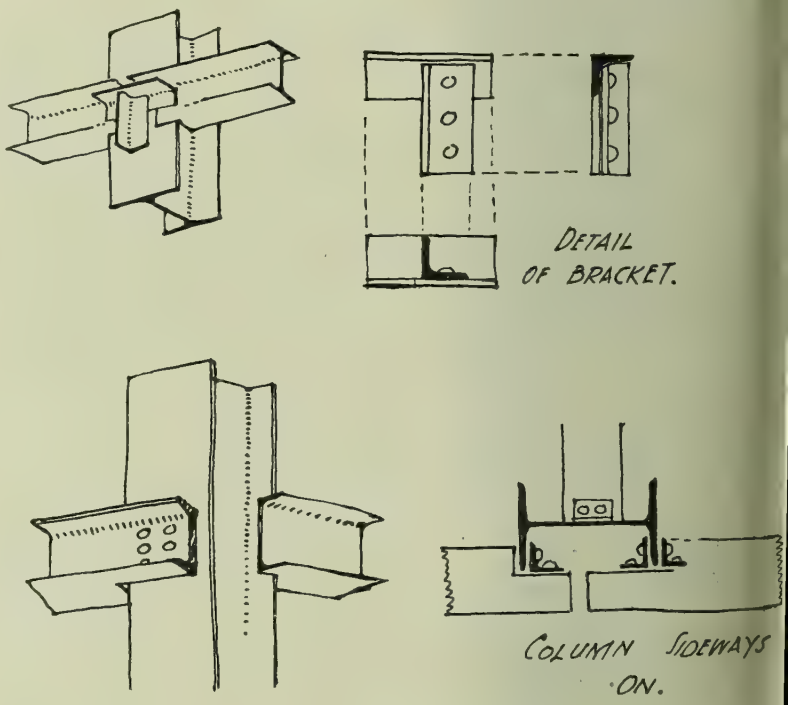


Fig. 47.

Walling.—The usual exterior walling is 12 in. thick, composed of acoustic tiles 8 in. thick and a 4 in. skin of face bricks. Fig. 48 shows a stone-faced wall, and Fig. 49 a solid brick walling carried on a concrete structure by means of continuous steel angles (the practice most favoured in Chi Bricks are of many varieties, the st size being about 8 in. by 4 in. by Exterior walling of the ground floor is su from the foundations and not hung steelwork, there being no beams at level. Indiana limestone is in general Portland stone is in London but block to be supplied in larger sizes. The ins all exterior walls are brushed over wit minous liquid waterproofing compound.

Sheet lead is not used, owing to hig copper or galvanised iron being subst R.W. pipes and gutters are always of co

Gypsum tiles, large, white, are co used for partitions: size 24 in. to 36 12 in. to 24 in. (Fig. 50). Partition wa tween flats, along halls, and around li sometimes double 4 in. tiles with 1 i ternal layer of deadening felt. Fig. 51 a normal wall and floor finish for livi bedrooms. Windows and doors are hollow metal, steel or "Kalamine." A able, all-metal fly screens are fitted to t side of most bedroom windows.

Rooms have a plaster finish. Met vanised iron angles are fixed to vertical of walls and wired plumb by metal w and plasterers just go straight to the (See Fig. 52). Papering is commen stippled finishes are becoming popular. ing for plaster is invariably of metal, normal form of lintel is the an (Fig. 53). Part of the angle is left e over the frame.

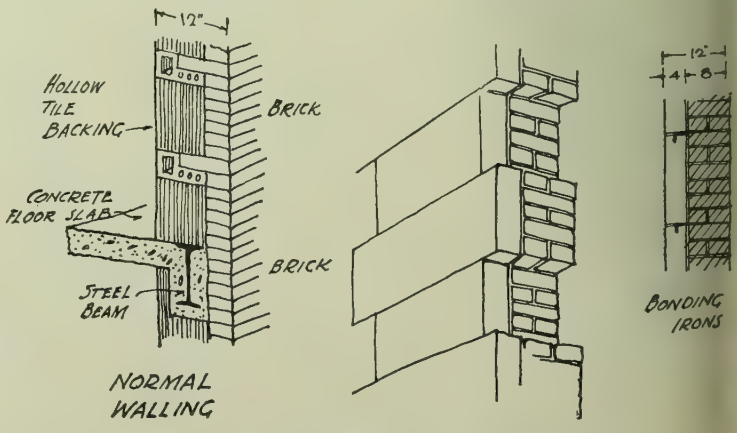

Fig. 48.

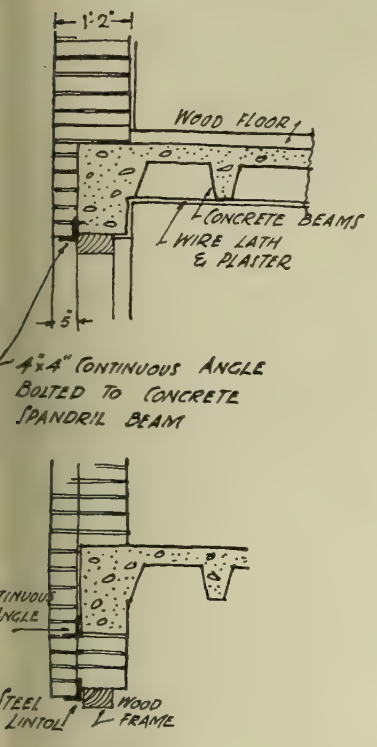

FIG. 49.

ORING, ETC.—The law regulates that may not be used in the main structure rs, roofs, walls, partitions, etc.; wooden g may, however, be used on top of the of floors within the flats. Floors are y made with 4 in. of concrete reinforced continuous wire mesh (Fig. 53). Wood g laid on sleepers and cinders as in 54 is common. Cement finish is used for rooms, corridors, etc.

fs which are concrete flat are covered 5-ply tar and felt waterproofing.

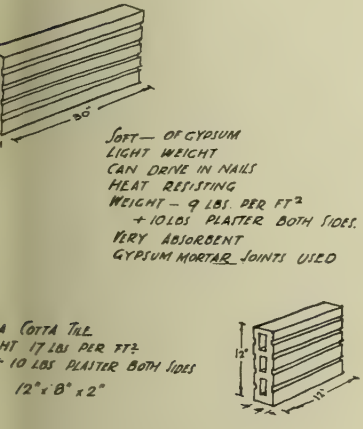

FIG. 50.

.'s are of pitch and builders' tar paper. d roofs, when they occur, are covered slates or asbestos slates. The English tile seems to be almost unknown.

ATING.—Practically all known systems of g are in use, but three types of steam g are most common:—

a) 1 pipe; (*b*) 2 pipe; (*c*) 3 pipe.

One pipe.—Condensed steam (equals) returns down same pipe. Pipes are but clumsy to install.

Two pipe.—Flow and return; pipes are smaller and the system works better.

Three pipe.—Flow, return and air. s good regulation; is a luxury and is expensive.

se systems require very little maintenance. The standard for smaller flats throughout the country is the 2-pipe gravity steam n. The vacuum systems are, however, preferred for the best class of work. There is only one type of these employed—on direct radiation. This system is preferred because it maintains an equal pressure throughout the system which is covered by the differential loop. The cost of installation is high, but its fuel consumption is economical. The system is usually designed to heat the building to 70 deg. when it is 0 deg. outside. As the boilers are not required in summer, hot water is heated separately. Steam is passed through coils in hot-water tanks. Sometimes heating is taken off the main, but a chimney is usually built as well, in case boilers are found to be necessary later on. If this is not done, the owners are entirely in the hands of the street supply, which may fail or become too costly to use.

Low-pressure steam heat is drawn off main and never gives off steam at the roof. Pressure is normally ½ lb. greater than atmospheric—21 lb. in very cold weather. It is said that town supply varies in cost and excellence and cannot be taken to some parts of the town owing to various obstructions. Some architects maintain that for flats it is much cheaper to generate own steam; two boilers, say, 16 ft. by 5 ft., are required for the heating alone—one as safety.

SANITATION AND WATER SUPPLY.—The regulations for plumbing, drainage, etc., are a great feature of difference between England

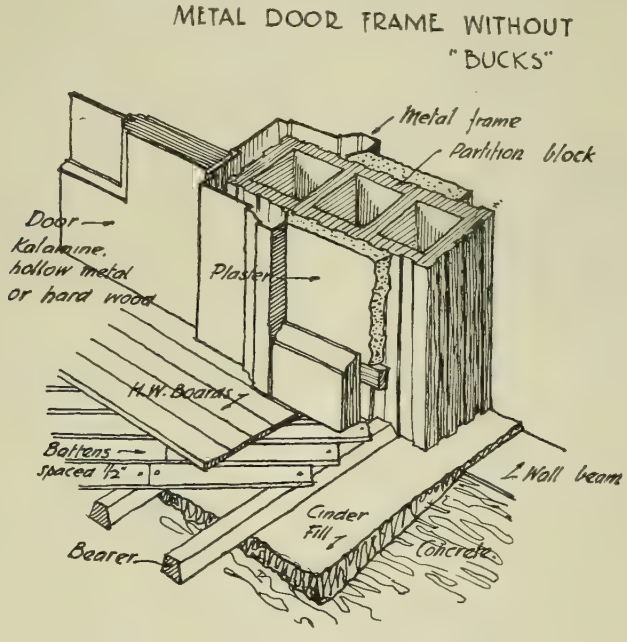

FIG. 51.

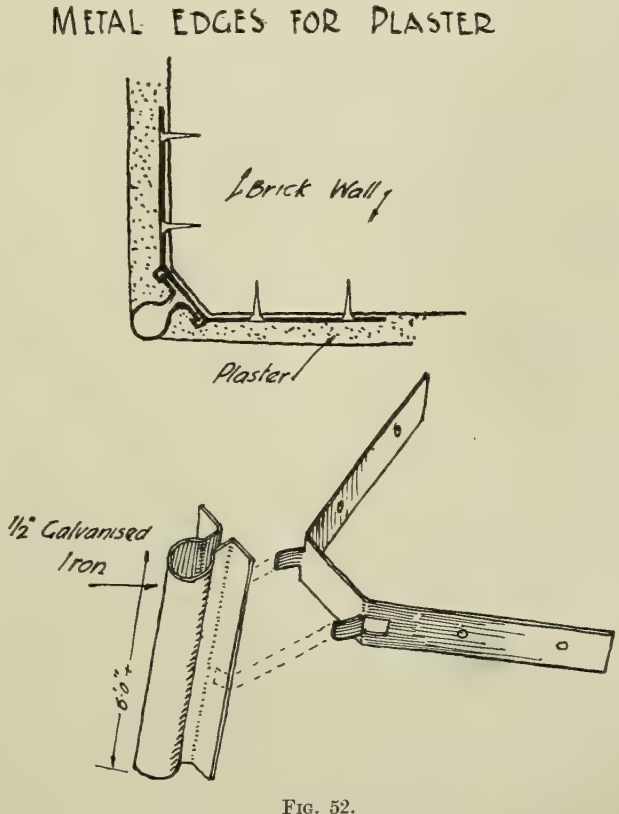

FIG. 52.

and America. Bathrooms may be entered direct from a bedroom. "The house drain must connect with . . . the house sewer . . . two feet beyond the outer wall," the law says. In place of the manholes required in England, only one earthenware "U"-shaped trap for the whole building is required. This, too, may be situated under the cellar. The usual measures to prevent syphonage and to provide

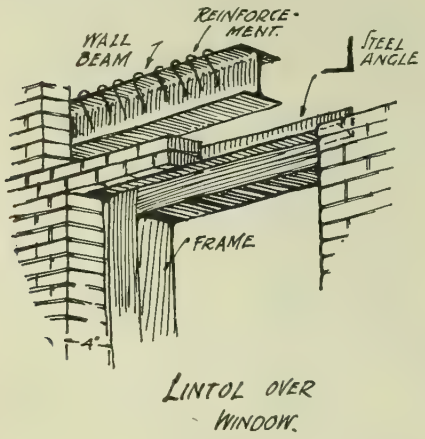

Fig. 53.

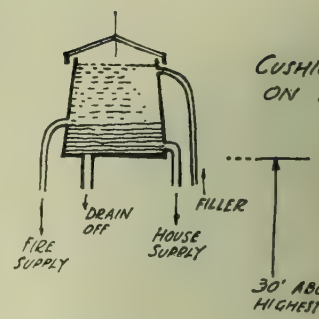
ventilation required in England are also required in the U.S.A. "All pipes and traps should, where possible, be exposed to view," the law again regulates. This means that all pipes may be run down through the building indiscriminately, be collected together at the cellar-floor level, run into the "U" trap, and then connection made with the sewer (see Fig. 55).

Water Supply (Fig. 56).—Internal water pipes are all of brass. Sizes of pipes required are:—Soil, 5 in. to 8 in.; kitchen waste, 3 in.; laundry tub waste, 1½ in.; kitchen sinks, 2 in.; other fixtures, 1 in. to 2 in.; main soil vent, 4 in.; main soil waste, 4 in. Drainage system (Fig. 55).

Electrical Equipment.—The current avail-

All concrete to be 1:2:5 cinders. 2. Galvanised wire mesh of American Steel and Wire Company. 3. Steel beams to have 1½ in. cover.



Mason's Work.—

Cement to be first quality Lehigh, Atlas, or equal Portland cement. Take 30 minutes for first set. Not contain more than 1.75 per cent. sulphuric acid or 4 per cent. magnesia, except La Farge or other stainless cement for stone work, marble or terra-cotta work.

Cinders.—Clean steam cinders.

Broken stone.—Broken limestone or trap rock, 2 in. ring.

Foundation concrete and steps.—1:2½ sand: 5 broken stone.

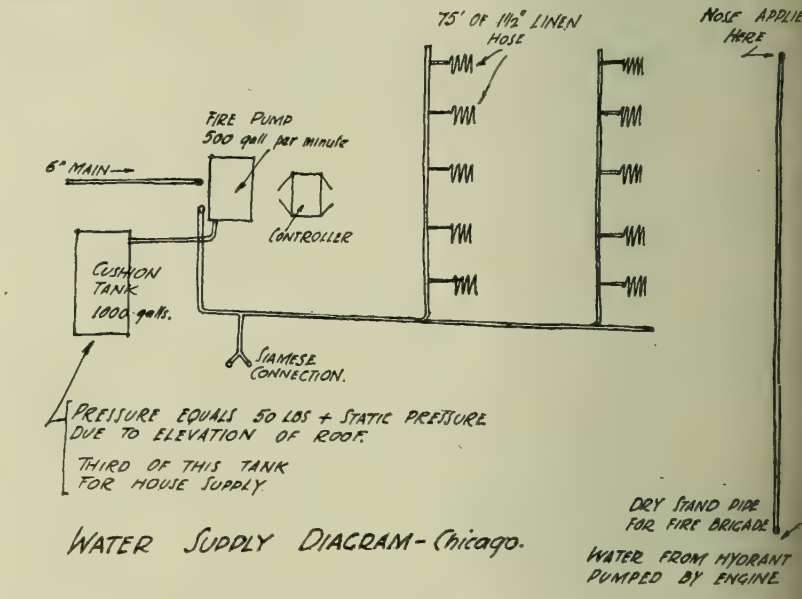


Fig. 56.

Sump to have 1 in. coat waterproof cement.

Finished cement floors.—1 in. thick of 1 cement, 2 sand.

Sanitary base=skirting.—Cement floors to

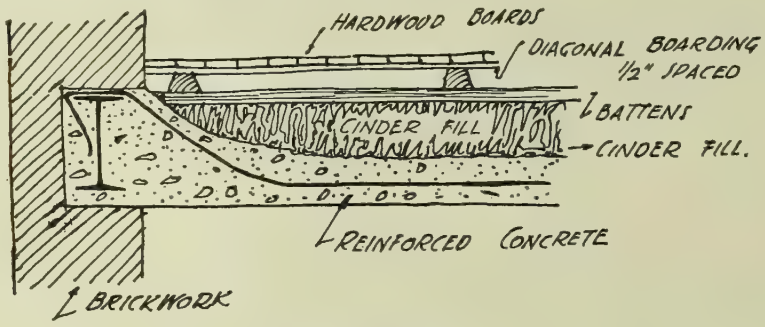

Fig. 54.

rs, temporary rails, temporary guards, porary enclosures, etc., boxing and pro- ion of stone, marble and brickwork, en- ing of building, cutting of woodwork for r trades, provide rough hardware=nails, e braces, log screws, angles = T-braces, s, bolts and nuts, enclosures of building trong muslin and wood frames.

NTERIOR TRIM=(joiner)=all woodwork not e by carpenter, doors, finished floors, wood ldings—handrails, copings, base, picture s, wardrobes, shelving, architraves—trim.

THE HURCULANEUM EXCAVATIONS

gnor Mussolini was admitted on Saturday as nonorary member of the Royal Society of an History. After receiving the diploma Duce made a formal announcement of the resumption of the excavations at Hercu- im, and of the measures for the recovery of wo Roman galleys which are known to lie ie bottom of Lake Nemi, near Rome.

ie Duce announced that the new excavations Herculaneum would begin in May in the nce of the King. There were great hopes, id, that Herculaneum would provide a rich st of archæological treasures, and it was for reason that the Government had consented rovide the necessary funds at a moment great economy was being practised in all ches of the administration. To prevent the ition of the mistakes made in the course of xcavations at Pompeii, the Duce said that new find was to be immediately photo- ed and fully made known to the public.

CORRESPONDENCE

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

The Registration Bill and the Engineers.

SIR,—The debate in the House of Commons on Friday last disclosed the fact that the Registration Bill will be emasculated, if it is to be amended to meet the demands of the Civil Engineers. We shall still suffer the infliction of engineers' architecture, or have designs created by their architectural assistants for which they claim all credit. We shall still see works hung at the R.A. obviously designed by qualified architects, rendered by eminent perspective artists, and submitted under the name of a county or borough surveyor.

The official architect expects no support from the R.I.B.A. and he is not disappointed, even though he is a loyal subscribing member of the Institute. He only hopes that the final clauses in the Bill will leave no room for the existing dishonourable and humiliating practices. In this connection it is pleasant to note in your current issue that in the work done by the Southport Municipality the architectural assistant's share in the designs has been duly acknowledged. This collaboration is so exceptional that it is worthy of note.

REGISTRATION BILL.

The Liverpool Cenotaph.

SIR,—The question of the situation of subsidiary monuments crops up on practically every occasion when a new monument is to be erected. This is really a town planning question. The answer appears to me as a town planner to be as follows:—The Cenotaph should take the form of a column, and the site should be the triangle created by the St. George's Hall south portico, the North-Western and Imperial Hotels. The use of the vertical in conjunction with the horizontal is seen to best advantage, perhaps, at the Church of St. Sophia at Constantinople and at the Taj Mahal at Agra. There pleasing contrasts are obtained. Circular towers have also been used in conjunction with churches in the Celtic period in Ireland. Similar conceptions of pleasing contrast, albeit the procedure is reversed, may be seen at Chichester, the Cathedral spire there contrasting pleasantly with the square bell tower.

As to the suitability of the column as a Cenotaph, Wren's monument is the precedent. May "The sculptures wind aloft
And lead, through various toils, up the rough steep
The heroes to the skies."

Moreover, there are practical considerations; for, besides balancing the Wellington monument, a column would add one of those islands which modern traffic congestion necessitates. And Liverpool would gain a viewpoint.

O. NEWBOLD.

An Architectural Appointment.

We have received copies of correspondence which has passed between Mr. John Mitchell, General Secretary of the Association of Architects, Surveyors, and Technical Assistants, and Mr. Percy Morris, County Architect, Devon, with regard to an advertisement for a draughtsman (which appeared in our columns a few weeks ago) at a salary of £130 per annum. In his first letter to the County Architect, dated February 26, Mr. Mitchell points out that the salary offered is "much below the average salary being paid by bodies similar to your own," and suggests that it should be revised. In a letter dated March 18 Mr. Morris states that "from the salary offered it is obvious that a junior draughtsman is required." In a reply dated March 29 Mr. Mitchell says that this explanation "ought to have been incorporated in the advertisement," and requests that his letter be brought before the Devon County Council "in order that it may reconsider the salary offered . . . which is less than it must pay to its general labourers."

SOCIETIES AND INSTITUTIONS

THE INCORPORATED ASSOCIATION OF ARCHITECTS AND SURVEYORS.

Liverpool and Cheshire Branch.

The inauguration of this branch took place at Liverpool recently. Following a conference of officials in the morning, a visit was paid to Liverpool Cathedral. Subsequently, about 60 to 70 members and friends took tea at Messrs. Francis's Cafe, Parker-street, and following, a meeting was held, the chair being taken by Mr. Wm. John Furbur (of Messrs. Thornely & Furbur, Liverpool). Addresses were given by the President of the Association (Mr. W. Forbes Campbell), the General Secretary (Major Athoe) and other speakers. The President, in acknowledging the welcome of the branch, said that he felt sure, judging from the attendance that day, that the branch would have a very successful career. He understood that the membership in the two counties was over 200 and the enthusiasm displayed was extremely encouraging to those who had done the pioneer work of the Association. The rapid growth of membership and the useful work that had been accomplished had brought the Association to a status such as to justify its being held as an established and recognised institution.

The General Secretary spoke on the Registration Bill and said that everyone who had the good of the architectural profession in mind recognised that registration was desirable. When the Registration Bill was first introduced it was of such a nature as to give monopolistic powers to one body, and for this reason the Association opposed it with all their might; but the speaker was pleased to say that many amendments had been made in the Bill and that several of the Association's objections had been met. It was not even now a perfect measure, and several more amendments would be necessary before it could be supported by the Association, but he hoped that the good feeling evinced in the negotiations that had taken place would continue with the ultimate result that a Bill would be produced of a workable nature and acceptable to all who had the best interests of architecture and its allied professions at heart.

CHANGES AT THE NATIONAL GALLERY

The National Gallery issues the following statement:—

Two new pictures are now on view at Trafalgar-square, both recently bequeathed by Miss Susan Field. The first is a view of Branch Hill Pond, Hampstead Heath, by John Constable, R.A., painted about 1823. In addition to being an excellent example of the artist's work at this period, the painting has a special interest from having belonged to Constable's friend, William Purton, to whom Constable said that the sky so satisfied and pleased him that he would never touch the canvas again for fear of spoiling it.

The second is a work by James Holland, dated 1843, and representing the Thames below Woolwich, a singularly original and well-designed piece of painting.

By order of the Board, these two landscapes, with other recent loans and acquisitions, including Titian's "Trinity," the "Three Marys," by Hubert van Eyck, portraits by Reynolds, Watts and Highmore, the Italian and Spanish primitives given by Lord Rothermere, and the little girl portrait by Seisenegger, presented by the National Art-Collections Fund, have been brought together in Room XXVIII, which was formerly devoted to works by Turner and Claude. A selection of the finest of the Turner drawings has been retained, and is exhibited in four wall-cases, the contents of which will be changed every two months in rotation throughout the year.

Disabled Warriors' Houses and Hall, Oadby, Leicester.

These buildings have been erected from a portion of the fund raised by Alderman Sir Jonathan North during the war for the purpose of assisting ex-Service men disabled in the war. They were opened by His Royal Highness, the Prince of Wales, on March 10 this year. The buildings consist of a hall and 10 pairs of houses, on a site the area of which is five acres. The houses are to be occupied by disabled men rent free. Private gardens are provided at the rear of the houses. The centre is laid out more or less formally with tennis court, bowling green and croquet lawn for the combined use of the occupants and their families. The recreation hall will be used as a reading room, recreation room, &c. The contractors were Bradshaw Bros., of Leicester, and the garden contractors Bradshaw & Sons, of Leicester. The following building materials are employed:—Brickwork, Staffordshire brindles; tiles, Tucker's hand-made (Loughborough); timbers to pergolas, larch and oak; stonework, reconstructed Portland stone; stone walling, Ketton and Bulwell; steps and pavings, self-faced York.

Messrs. A. E. & T. Sawday, A.R.I.B.A., are the architects.

Besford Court, Worcestershire: New Industrial Block.

This scheme is part of a large block of buildings carried out by Messrs. Sandy & Norris, forming a large mental welfare centre in Worcestershire. The building illustrated was designed on the unit principle, and is being carried out entirely by the boys of the institution, whose ages range from 14 to 18 years. The stone was sent on to the site ready worked and merely fixed by the boys, but the whole of the foundation work, plumbing, roofing, &c., is being carried out by them. The buildings when completed will form practical demonstration rooms for teaching the boys, who are coached under special instructors, the respective building trades. The experiment is an interesting one, as showing the work that mentally deficient boys are capable of carrying out under proper supervision.

The stone for the building was supplied by the Empire Stone Co., Ltd.; the heating installation by Couzens & Akers, Ltd., Birmingham; the steel windows by J. H. Walker, Ltd., West Bromwich, and the steel roof principals, &c., by Lambourne & Co., of Openshaw, Manchester.

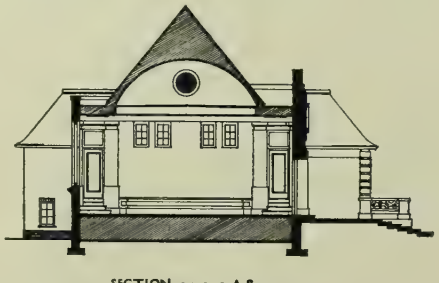
The whole of the work is being carried out under the supervision of the architect, Mr. E. Bower Norris, F.R.I.B.A., of the firm of Sandy & Norris, of London, Manchester and Stafford.

Staffordshire General Infirmary: New Nurses' Home.

This new building, which has been erected on a site immediately adjoining the Staffordshire General Infirmary, provides accommodation for twenty-eight nurses. Each nurse has a separate room, average size 12 ft. by 9 ft., with hot and cold water in each bedroom; there is also spacious accommodation on the ground floor for retiring rooms, Matron's office, &c. The building is carried out in Blockley multi-coloured facing bricks, with Colwich sand-faced stock dressings to all windows, doorways, &c. All the sash windows, &c., are in hardwood, and the floors generally are finished with oak wood blocks. In designing the home, the architect had to bear in mind the close proximity of the large Infirmary, and therefore adapted in style a building with as large a scale as possible.

The general contractors were: Messrs. F. Espley & Sons, of Victoria-road, Stafford, and the following were the sub-contractors: Jos. F. Ebner, wood blocks and composition flooring; The Seigwart Fireproof Flooring Co., Ltd., hollow floors; Empire Stone Co., Ltd., stone dressings; Lambourne & Co., Manchester, steelwork; Parker, Winder & Achurch, Ltd., Birmingham, door furniture; Expanded Metal Co., Ltd., ceilings, &c.; J. Ashton Floyd, Manchester, architectural carvings; H. Pratt, Ltd., Aston, Birmingham, electric lighting; H Pratt, Ltd., plumbing and hot water service.

The building was designed and carried out by Mr. E. Bower Norris, F.R.I.B.A., of the firm of Sandy & Norris, of London, Manchester and Stafford.



London County Council Schools.

County Secondary School, Sutherland-grove, Putney.—This secondary school for boys is shortly to be erected at Southfields. The site is of about seven acres, with a sharp fall to the east, and, apart from the school building and its immediate surroundings, is terraced and levelled to provide playing fields. The school building is set back from the road on the highest portion of the site, and is planned according to the old tradition of English scholastic foundations around the sides of a quadrangle; that to the front, however, being left open above the entrance screen. The principal entrance is from the quadrangle, and with the administrative and staff rooms adjoining, admits directly to the assembly and dining hall, the dominating apartment of the building and the focussing point of all school life, scholastic and social.

The south wing is occupied on the ground and first floors with classrooms, and the north wing with the gymnasium and art room and the science laboratories. The kitchen quarters are adjacent to the hall on the north side, and over them a library and a lecture room are provided. Every advantage has been taken of the sloping site to obtain the extra height required for the gymnasium and to provide accommodation for the heating chamber, manual training workshop and cloakrooms, these being entered from the students' entrances at the eastern ends of the school. The lavatories, w.c.'s and urinals for the use of the boys are adjacent, and are masked to form an entrance to the quadrangle. The building will be externally faced with red bricks with a brown brick base, and Portland stone dressing to the principal entrances have been sparingly introduced; the roofs will be covered with Cornish green slates. Fire-resisting material will be used throughout. Accommodation is provided for 505 boys.

London Fields School, South Hackney.—This is a three-story elementary school, built on the site of the old school, which was erected in 1874. The school provides accommodation for three separate departments, viz., on the ground floor, 432 infants; first floor, 360 boys; second floor, 360 girls; total, 1,152, with an assembly hall for each department. The exigencies of the site and aspect led to a "T" shaped plan being adopted, the halls being situated on the west wing. The entrances are on the north front with staircases, cloakrooms and lavatories adjoining, an additional emergency staircase being at the extreme south end of the building with communications to each floor and carried up to the roof playrgound used by the girls department. The materials are stock brickwork with artificial stone dressings. The school building has lately been completed and opened for use. The contractors are Messrs. C. P. Roberts & Co., Ltd.

Both these schools have been designed in the Architects' Department of the L.C.C., under the personal supervision of Mr. G. Topham Forrest, F.R.S.E., F.R.I.B.A., Chief Architect to the Council.

SECTION ON LINE A.B.

Disabled Warriors' Homes, Oadby, Leicester: Section.

Messrs. A. E. & T. Sawday, A.R.I.B.A., Architects.

Chislet Colliery Village.

Reference to this new village, the Institute of which (Mr. George J. Skipper, F.R.I.B.A., architect) we illustrate in this issue, is made in the paper given by Professor Patrick Abercrombie at the R.I.B.A., on Monday evening last, a report of which appears on page 596.

BRISTOL REGIONAL PLANNING

At a meeting of the Bristol, Bath and District Joint Regional Planning Committee, held at the Council House, Bristol, Alderman Dowling was elected as chairman in succession to Sir John Swain.

In presenting the interim report, Professor P. Abercrombie said the factors governing transport requirements in the region were a great centre of population entailing improvements in by-passing, a highly-marked topography causing main routes to be marked with clearness by natural features, the possibility of new traffic features of national importance, such as the proposed crossing to the Severn. There was need to push on with that part of the scheme as several local authorities were anxious to prepare their town-planning schemes concurrently with the regional plan.

Dealing with zoning, the speaker said the zones would be divided roughly into three categories, industrial, residential, and open or agricultural. The zoning shown in a regional plan would be restricted to main lines only, leaving town-planning schemes to sub-divide and introduce further detail. Dealing with residential developments, the Professor said it would be the aim of the zoning plan to localize these areas of residential development. It was desirable that they should be comparatively compact in order to avoid extravagant straggling over the countryside, and particularly the objectionable form of development known as the "ribbon." There was no desire to limit the amount of residential growth, but to determine the placing of it. A careful survey was being made of the old towns and villages with a view to suggesting local internal improvements or external by-passes to avoid touching them. Two authorities had still refused to join the Region, which was regrettable, as the two gaps on the area were likely to impair the completeness of the report.

Mr. G. Topham Forrest, F.R.I.B.A., Chief Architect to the Council.

THE ARCHITECT'S REGISTRATION BILL

The Architects (Registration) Bill was, on Friday, April 8, read a second time in the House of Commons, and afterwards committed to a Select Committee.

Sir Clement Kinloch-Cooke (Cardiff E, U.), in moving the second reading, said that the Bill was promoted by the Royal Institute of British Architects, upon which the duty of the training of architects and the control and guidance of architects had been conferred by successive Royal Charters. Among its members would be found the great majority of qualified architects practising in all parts of the British Empire. Whether domiciled in this country or overseas, all members had an equal right to have their say in the government of the profession, and over 8,000 persons who had been admitted to architecture were directly associated with its activities. The R.I.B.A. had some claim to be regarded not only as a great British organisation but as an Imperial organisation. After dwelling at some length on what the R.I.B.A. had done for architects and architecture, the speaker said that the organisation formed for the voluntary registration of architects was in 1925 taken over by the R.I.B.A., and since that time it had remained under their control. It was a significant fact that some 800 architects and assistants, not members of the Institute or of allied societies, had already enrolled themselves on that voluntary register. A system of voluntary registration was all very well, but it did not go far enough. It did not carry with it statutory authority, and that was where it failed. What was wanted was registration having legal authority behind it, making it compulsory for all persons wishing to be officially recognised as architects to enrol themselves and submit to restrictions embodied in an Act of Parliament, just as did the legal, medical, and teaching professions. The public, in those professions, were safeguarded against unqualified persons by means of registration having the authority of law, and by the present Bill it was proposed to give the same protection to the public in the case of architects. Accordingly, the Bill provided that any person desiring to practise as an architect should furnish himself with credentials carrying this statutory authority, and showing that he had received the necessary preliminary training and passed the necessary preliminary examinations. The same machinery that gave protection to the public would also protect qualified architects from the competition of unqualified persons, and, incidentally, by a process of elimination, the profession would be saved from the risk that now assailed it of being placed in an undignified position by the wrongful acts, whether due to want of knowledge or otherwise, of persons describing themselves as architects, but who, neither by training nor profession, were qualified for the work that they themselves had to undertake. In those professions where statutory registration obtained the position of members had undoubtedly been raised, and the public had not failed to take advantage of the opportunities afforded them for their own protection. Was it not reasonable to suppose that methods which had had such far-reaching results in other professions should meet with the same good fortune in the profession of architecture? The wonder was that so useful and desirable a reform had been so long delayed. This country was one of the few where architects were allowed to practise without any statutory qualification. It was a common view to take that the services of a trained architect were only necessary in the case of works involving great expense. No view could be more fallacious. We should not get the country architecturally efficient unless it was realised that there was no building, however small and simple, but would benefit by being the subject of trained architectural design. While he did not propose to go into all the clauses of the Bill, he would like to call attention to one or two points. Not only would all *bona fide* architects come on to the register without examination, but they would not be required to pay any entrance fees, nor would they be required to pay any renewal fees. No one was deprived of any right which he now enjoyed. Similar privileges were to be extended to other classes of persons engaged in the architectural profession. The interests of professional members of kindred institutions were also very carefully preserved, and nothing in the Bill would affect any act or operation in connection with the construction of buildings or the validity of any act of any person under any customary form or condition of a building contract. Neither did the Bill prevent any local authority or persons performing any act or operation in connection with the construction of buildings which such local authority or persons were entitled to perform previous to the passing of the Bill. The measure might briefly be said to protect the public by ensuring the proper training of persons holding themselves out to be architects and to protect the qualified as against the unqualified architects, and to provide an organisation for facilitating and developing architectural education available for all classes. Co-operative societies, under the Bill, would be able to carry on exactly the same work as they were doing now, provided only that they employed a registered architect. He understood that the Bill was to be opposed on the ground that it would interfere in the freedom of artists. Hon. members might ask, "What would have happened to Sir Christopher Wren if he had failed to register?" It was a fact that though Wren did not begin his career as an architect, it was undoubtedly his professorship in astronomy, which involved a great study of geometry, that first led him towards architecture. To say that he was not trained in the first principles of architecture was to misunderstand what constituted the first principles of architecture. If Wren had not been one of the best-educated men of his time he would never have been an architect. All through the ages it would be difficult to prove that any building was erected by sheer inspiration. On the other hand, the better the architect's training, the better would be the buildings that he constructed. With regard to the attitude taken up by the Institute of Builders, many of their criticisms had already been met, but he might say for their benefit that there was nothing in the Bill to interfere in any way with the design or construction of building. The only thing the promoters wanted to provide against was that the title of architect was not used in any other way than that intended in the Bill. After expressing his willingness to meet all reasonable amendments in Committee, the hon. member concluded by pointing out that there was no intention or desire to make the profession a close profession.

Lieut.-Col. Moore (Ayr Burghs, U.), who seconded, said that, side by side with beauty of design, there had marched in the architecture of our streets intolerable and unutterable ugliness of design, the result of untutored minds and an absolutely inadequate professional education. He was amazed and ashamed to see the misery and degradation of the slums, and how courageously it was borne by the poor people who had to endure the bad, ill-designed and poverty-stricken work of past builders and architects. For the sake of the poorer people he said, "Away with these quack jerry-builders calling themselves architects, and give us instead a profession of expert enthusiasts, who will bring graciousness and comfort even into a two-roomed house." What was wanted was to develop the profession into a community of practical idealists. There were four clauses in the Bill which really mattered. In clause 5 they had made an endeavour to bring within the scope of the Bill all those practising or student architects who, while possibly not members of the R.I.B.A. or other kindred organisations, were fully qualified or were in process of being fully qualified to give an adequate standard of architectural service to the country. In clause 10 they had [illegible] deavoured to remove the possibility of injust[ice] being committed towards any member of [the] profession by being refused admission to [the] R.I.B.A., or by being removed from [the] register, by allowing an appeal to a court [of] law. In clause 11 they had endeavoured [to] safeguard the use of the word "architec[t]" and to preserve for that word a definite val[ue]. The public would then be paying for a standa[rd] of education which they would be entitled [to] get. The promoters had done their best [to] make the Committee and Council as rep[re]sentative as possible.

The rejection of the Bill was moved by M[r.] A. V. Alexander (Sheffield, Hillsborou[gh] Lab.), who said that the practice seemed [to] be growing of laying before Parliament [a] whole series of measures providing for n[ew] close corporations. He could understand [a] very strong prima facie case being made [out] for setting up close corporations in the ca[se] of the medical or dental professions, where [the] health of the people was concerned, and wh[ere] in the past serious results had arisen fr[om] people practising in a professional mann[er] without professional qualifications. But if [the] example of the medical profession was go[ing] to be followed in the case of every other p[ro]fession in the country, it would soon beco[me] almost impossible for the working-class b[oy] or girl to find a really broad highway into [an] employment or vocation which they had [as] much right to enter as anyone else. If [the] promoters wanted to get support from [the] working classes for such a Bill as this, th[ey] would have to provide on the advisory bo[dy] for the representations of such organisatio[ns] as the Workers' Educational Association [or] the Central Education Committee of the C[o-] operative Movement. Was there any reas[on] why a boy who qualified by passing examin[a]tions such as those conducted by the Ro[yal] Society of Arts or the Union of Educatio[nal] Institutions at the technical school, or [the] school of art, should not afterwards with th[e] qualifications, plus actual practical experien[ce] be able to practise in the architectural p[ro]fession if he so desired? With regard to [the] position of the co-operative societies, he s[aid] that not only those societies, but many ot[her] corporate bodies, such as banking institutio[ns] limited companies, and municipalities who e[m]ployed salaried architects, desired to have c[on]served in the future their right as corpor[ate] bodies to employ architects, so long as th[ey] paid reasonable professional salaries for a [full] architectural service of the best kind. T[hey] were, therefore, nervous about the interpretat[ion] of the clauses which dealt with the prescript[ion] of future qualifications, the removal of na[mes] from the register, and the setting up of [a] statutory body which, among other thin[gs] would have the right to lay down what [was] or was not professional. The real point of [the] Bill was what was or what was not un[fair] competition. He was anxious to maintain [the] avenue to a better standard of architecture [for] members of the working class, and also [to] maintain the possibility of getting the hig[hest] architectural service provided for the wh[ole] of the community and not merely a sectio[n] it. He moved his motion for the rejectio[n] order that the whole matter might be deba[ted] but he was quite prepared to negotiate i[n a] friendly spirit.

Col. Wedgwood (Newcastle-under-Ly[me] Lab.), who seconded, said the question [was] whether Parliament ought to extend the p[rin]ciple of insisting on examinations being pa[ssed] and a certain technical standard being rea[ched] in other professions as well as those affec[ting] the public health of the people. If they [were] to go outside those professions which dire[ctly] dealt with the public health, then indeed t[here] seemed to be no limit to the number of [pro]fessions which, by an Act of Parliament, [they] could bring into the blessed position of b[eing] close professions, with restricted competi[tion] According to the Bill the existing archit[ects] were to be exempted from all tests and q[ua]

tions. Those people who built slums would be affected by the Bill; they would still tinue to build such houses. All that would pen under the Bill would be that in future one could come into the profession without ing passed the examinations. Was that he advantage of the public? In the first e, it must obviously restrict the number of itects. Any passing of examinations must lve higher education and expensive train- which would to a certain extent limit the ber of candidates going into that pro- ion. As the supply of architects was re- ed, so the cost of employing each architect t go up automatically. It was true that r fees would be regulated, but there were r ways in which the cost of employing an itect could rise. The object of the Bill to see that bad building did not go on in future. Therefore, they had not only a which would restrict the number of archi- s and make it more expensive to employ architect, but a Bill which did not attempt prevent the builder going on as now, and ting up those buildings without an archi- . There was nothing in the Bill to compel lders to employ architects, and if there e the Bill would not have a chance of ting through. So that the Bill would not the public to secure better houses. All t it did was to secure a limitation of the itects available, so that those architects ld be able to charge higher fees. That was in the public interest.

Sir Alfred Hopkinson (English Univer- es, U.) said he felt bound to support the ses of the Bill which had as their object promotion of architectural education. ere was nothing more striking in the istic and intellectual history of English life n the way in which architecture had pro- ssed. He need only mention the magnifi- t pile of buildings which had been erected Bristol University and the Rylands rary at Manchester, and compare them h the early days when certain buildings re put up in Oxford and Cambridge. He ed the Bill would be read a second time, ause he believed it would help forward archi- tural education, and, incidentally, archi- tural art. But unless certain amendments re introduced he would be bound to vote inst the second reading, and do everything could to prevent the Bill from passing. The clauses in question were clauses 11 and 12. those clauses were retained they would be ding another bad example to the many bad amples which had been brought forward ely of more and more restraining people and tailing liberty. It was about time that y got rid of this perpetual creation of new ences. Clause 11 said that if a man used term "architect" or "architectural" in nection with his business, unless he was istered, he was committing a crime. That s another interference with liberty. What y could say was that if a man used the m "registered architect" when he was not the register, then he should be liable to penalty, because he was telling a lie to get ney. He objected to the manufacture of hibitions interfering with ordinary liberty. man who was not on the register might be e of those people so constituted that they l not care to go through a regular course of dy. He might be a man with original as, and should he be brought into that cast- n mould? In matters of artistic taste there uld always be absolute freedom. The idea at a man, however distinguished he might must necessarily be a better architect be- se he was on the register was an absolute lacy. The most horrible and inconvenient ildings had often been put up by very dis- guished architects. Sir Alfred added that Wren had not been on the register when he ilt St. Paul's Cathedral he would, under use 11 of the Bill, had it been in force, ve been a criminal, liable to a penalty of £50.

Mr. D. Cowan (Scottish Universities, L.) pported the Bill. The time had now come, said, when, in the interest of the public nerally, there ought to be a specified and definite meaning for the word "architect." At the same time, there were provisions in the Bill to which he took strong exceptions. Both in the body of the Bill and in the Schedule there was room for considerable improvement.

Major Hills (Ripon, U.) declared that the Bill created a new monopoly, and made a new crime. There were two classes of interest concerned in the Bill: first, the public interest; and secondly, the professional interest. The public interest was best served by the largest supply of well-qualified architects. But did they get the best qualifications by examinations and registration? In certain professions they did best by testing and registering, but in architecture quite different considerations arose, for the ultimate judge of architecture was not the person who conducted an examination, but the public. They had at this time some of the finest architects that this country ever possessed. The cloister at Winchester, erected by Sir Herbert Baker, was one of the most exquisite productions of the human imagination. Then there was some work of Sir Edwin Lutyens, and Scotland also could produce Sir Robert Lorimer; but alongside of those artists there were to be found a very large number of very indifferent architects. He could show hon. members a building designed by a distinguished architect which he thought was the ugliest building in the world. So they did not get the best art by registration. He went further than that and opposed the idea of an academy of art which could lay down a standard to which all practitioners must conform. The Royal Academy had never said that nobody except the persons described and registered as portrait painters could paint portraits. To do so would be to make a monstrous and extravagant claim, but that was exactly the sort of claim the Bill made. Nobody could call himself an architect unless he was registered under the Bill. The case of Wren had been mentioned, but Wren was never an architect at all. He started as a mathematician, an anatomist, and a man of science. He was for thirteen years Savilian Professor of Astronomy at Oxford, and during that time he produced some of his finest architectural work. It was quite clear that if Wren had been alive to-day and had practised his astronomy he could not have practised as an architect; and if the R.I.B.A. had been in existence in Wren's time, then Wren would never have practised. Further, it must not be forgotten that architecture touched art at several points. One could not say where sculpture ended and architecture began, and one could not, at certain points, say it was not architecture, but sculpture. If this Bill were passed, the sculptor would be compelled to divide his design between himself and an architect, for he could not practise as an architect. They would not get that unity of construction which was so advisable, and the Bill would not assist professionally either the practitioner or the public. Clause 12 said: "A person shall not be entitled to recover any charge in any Court of Law for any professional services rendered as an architect unless he is a registered person." When the Bill came into operation nobody would be able to do architectural work and charge for it unless he was a registered architect. That was exactly the same thing as had happened in the United States, where there had grown up a large body of energetic and original architects who had refused to enter into a close corporation and had called themselves by various names in which the word "architect" was not used. He objected to a monopoly in any word which described a very important art. By that process they excluded the original genius, the man who would not be bound by rules, who worked on his own methods, while at the same time they let in the auctioneer or the surveyor who could still describe himself as an architect although he had had no architectural training whatever. This policy would do no good to the profession, and no art would flourish in chains. The Bill would make the education of the architect much too close. It had been suggested that clauses 11 and 12 should be omitted, but if that were done there was nothing left in the Bill. Until those two clauses had been omitted, however, he should oppose the Bill at every stage.

Mr. Gardner (Hammersmith N., Lab.) supported the Bill. Speaking as one who knew something of the work of the architectural profession, he said that the houses built by members of the R.I.B.A. compared very favourably with those built in days gone by. It was important that people claiming to be architects should show some ground for their claim. The R.I.B.A. had done a great deal for higher education in architecture, and it was not true to say that the Institute was trying to create a close profession. They had spent considerable sums, without any State assistance, on architectural education, and in eighty years they had spent £200,000. If he thought there was anything in the Bill to shut out a working man or boy from becoming an architect the Bill would not receive his support. In regard to a man who had had no training whatever as an architect but who by sheer artistic sense and development and an interest in the profession suddenly came into it, the Institute had the power, and they exercised that power, of making him a Fellow. Wren himself, if he were alive to-day, would not be a registered architect, because he was not trained as such, but the Institute would recognise him as an architect, and elect him as a Fellow. There was also another point. Architects to-day, he was sorry to say, in many cases abused the position of their clients, and the Institute had not the necessary power to deal with them. An architect was in a peculiar position. One of his duties was to protect those for whom he was acting from rapacious contractors and shoddy work. There was a standard of professional conduct among architects which was supposed to be observed, but he was sorry to say that, in some instances, it was not observed. Secret commissions and that kind of thing ought to be stopped, but until they got registration they could not stop them. He, however, could not support clause 7, which conferred on the Board the right to strike a man off the list if he was convicted of a misdemeanour. There was one point which would commend itself to the Labour Party, and that was the fact that the promoters of the Bill had agreed that a representative of the National Federation of Building Operatives should be on the Board. This was the first time that a professional society of this country had ever agreed to give Labour representation in the appointment of such people.

Sir George Berry (Scottish Universities, U.) also supported the Bill, but favoured various amendments being made in Committee.

Mr. Tasker (Islington E., U.) said all architects supported registration, which was not a new thing when he entered the profession forty years ago, but the difficulty was to define registration. How were they going to confine the great and noble art of architecture in a strait-waistcoat? The great architects and artists of the past were not men who had passed examinations. One of the most remarkable buildings in London to-day was the Catholic Cathedral at Westminster. The designer of that building was a clerk of the works. He passed no examinations set by the R.I.B.A. or anyone else. He was a genius and he gave this country a splendid building. Was that to be denied to posterity because the R.I.B.A. wanted to force through Parliament a Bill about which their members had not been consulted? He deeply deplored the methods adopted by the R.I.B.A. in their attempt to persuade the House to pass a Bill. The R.I.B.A. claimed to represent about 8,200 men, but they had not even taken a referendum of those whom they claimed to represent. They called an extraordinary special meeting of their Fellows, Associates and Licentiates to determine whether or not this Bill should be proceeded with. The majority of the 1,300 Fellows had passed no examination at all, and of the 2,200 Licentiates

he believed that not one had passed an examination. Why, then, should the proposed monopoly be given to people who had no qualification, if they were to accept the standard set up by the R.I.B.A.? If the Institute claimed that the art of architecture was to be so sacred, why did they not say that every architect must confine himself to that profession? If architects wanted to be on the same plane with advocates, solicitors or doctors, let them practise architecture, and architecture alone. The Bill was an attempt by the R.I.B.A. to control the whole of the architectural profession of the country.

Mr. Palin (Newcastle W., Lab.) announced that he would vote for the Bill because of the great principle of trade unionism underlying it.

Sir M. Macdonald (Inverness, L.) stated that the Institution of Civil Engineers, a body which comprised more than 10,000 members, through its council, was unanimously of the opinion that the Bill should not be passed in its present form because it interfered with the privileges and the position which the engineering profession had hitherto occupied *vis-à-vis* the general community. Engineers, he said, were responsible for a good deal of architectural work. The educational standard provided by the Institution of Civil Engineers was of an even higher grade than that of the R.I.B.A., and the safety and stability of the structures erected by engineers were greater than in the case of structures erected by architects. Most modern buildings were, in fact, built on the plans of structural engineering. The Bill would put an end to that branch of engineering.

Dr. Watts (Withington, U.) supported the Bill because, he said, it would put an end to the quackery of men being allowed to practise as architects for the sole reason that they called themselves architects.

Mr. Viant (Willesden W., Lab.) opposed the Bill, which, he said, was in no sense a trade union Bill, but set up a close corporation. There was no provision in the Bill to safeguard the interest of the community. There was no guarantee that the road would be kept clear for talent and ability to reach the top. He suggested that the Bill should be referred to a Select Committee.

Col. Crookshank (Berwick, U.) congratulated the promoters of the Bill in bringing forward a very important measure. He gathered that its object was not so much to improve the status of architects as to improve their training, and in that way to benefit the public at large. He contended that the architect must have knowledge of construction as well as of art.

Captain Wallace (Hornsey, U.) said that the Bill not only sought to create a corporation of architects, but it was also meant for the express purpose of linking up architectural study with the general educational system of this country. The promoters had authorised him to say that they were prepared to make important concessions to meet the views that had been expressed in the debate. They were prepared, in reply to Sir A. Hopkinson, to delete altogether clause 12, which referred to the recovery of charges, and to recast clause 11 so as to meet the objections which had been raised on behalf of the civil engineers. They did not wish to tie themselves down to the use of the word "registered," but they were willing to consider the use of some qualifying word. Any alterations which were necessary to meet the differences of conditions and nomenclature in Northern Ireland would be sympathetically considered by the promoters. The Bill was really based on three propositions:—That the establishment and maintenance of a high standard of architecture was a matter of public concern and importance; that to obtain that high standard architects must be trained and educated; and that the trained man must be distinguished from the untrained architect. He believed that the Bill would be of profound benefit to future generations.

Sir W. Joynson-Hicks, the Home Secretary, said that to one part of the Bill the Government gave unreservedly their full support. That was the part that dealt with architectural education. It was very desirable indeed that a building architect should be brought into touch with the great educational institutions of the land, and that the highest form of architectural education should be given to a man who was going to practise architecture. In that respect he, personally, was rather tempted to divide the architectural profession into the scientific side of architecture and the artistic side of architecture. There was no doubt whatever that, from the point of view of the scientific side, it was essential that proper conditions as regarded stresses in steel girders and so forth should be maintained in any building that was erected. It was in the highest degree desirable that there should be the fullest scientific attention to those matters, and, as he thought, an examination and probably a register of all men who were going to undertake the scientific side of architecture. On the other hand, he was a little inclined to feel that the Bill, though he was not going to oppose it, might perhaps in the future cramp the artistic side of architecture. After all, the great architects of the past were neither scientific nor registered. Right down through the whole history of architecture it would be found that in the great buildings of the past, in whatever period, from Babylonian days, through the Middle Ages, in this country and in Europe, the architect was almost essentially first an artist, and it was his creative genius, not measured by rule of thumb, not measured by scientific education of any kind, that caused him to design and build most marvellous buildings which were the wonder of the world. He (the speaker) was a little afraid, although the Government were not going to oppose the Bill, lest the closing of the architect's profession would have the effect of making that profession a close corporation. Law and medicine were both close corporations, but neither law nor medicine had very much to do with art. He hoped that the promoters of the Bill and the Council of the R.I.B.A. would very seriously consider this question, and would take the utmost possible means to prevent the stifling of artistic genius, wherever it might be found, although it might be in a member of a registered corporation. Dealing with some minor points in the Bill, the speaker said he thought it was worth while considering whether the term "architect" in the Bill should not be changed to "registered architect." That morning he had had an interview with a deputation from the Council of the R.I.B.A., and they told him that it was not their intention, and it was not the intention of the Bill, and that they were perfectly prepared in committee to make it clear that it was not their intention, to prevent anyone from building or designing, or charging for building or designing, a house or any other edifice, provided only that he did not call himself an architect and charge as such. If the title were limited to "registered architect" it would go a long way to meet the objections raised in the debate. He was, however, going to ask the House to adopt the suggestion that the Bill should be referred to a Select Committee. It was not altogether a public Bill, it was a Bill promoted by a particular organisation. They had, of course, had similar Bills before. There was the Opticians Bill, which had recently been referred to a Select Committee. He thought that it was in the interests of the public as a whole that the present Bill should receive that kind of consideration which a Select Committee alone could give it. The mere sending of a Bill to a Standing Committee upstairs, where everyone would be able to make speeches from pre-conceived ideas, might not proceed in producing a good Bill; but, on the other hand, there were great advantages in careful examination by a Select Committee, before whom the R.I.B.A. could themselves appear, either by counsel, if they wished, or by members of their own body, and before whom the builders, who he understood were strongly opposed to the Bill, could put their case. He was glad to be able to inform the Ho that the Council of the R.I.B.A. had him a few hours earlier and were quite pared to assent, and authorised him to that they assented to that course. In th circumstances it would be fair to ask House to give the Bill a second reading, then for the promoters to move that it referred to a Select Committee, where all technical matters might be fully conside and possibly afterwards it might be sidered either by a Standing Committee by a Committee of the whole House.

Mr. Wallhead (Merthyr, Lab.) said the interests of the working people must safeguarded. If they were to have close porations they must be fairly open to e from every class of the community. T was a movement for the preservation of tage architecture. Probably many of t examples were not the work of architect all, but the outcome of local gifts of cr manship, accompanied by little, if scholastic attainments.

Sir R. Horne (Glasgow, Hillhead, U.) it was of the highest importance that houses which were to be erected should only be good in respect to their design, that they should also be of a character would render life comfortable, and which people could rely as produced by best scientific methods. Both of those siderations justified the view that, in to secure an accomplished body of peopl protect the public, they should have a r tered body of architects. As it seemed t the desire of the House that the Bill sh go to a Select Committee he took no obje to that course.

Sir F. Rice (Harwich, U.) said that had been asked to present the views of Institute of Builders. As those views already been put forward during the de and as it had been decided to refer the to a Select Committee, he left the m there.

Mr. H. Williams (Reading, U.) suppo the Bill, and then Mr. Alexander, in vie what had been said by the Home Secre withdrew his motion for the rejection of Bill.

The Bill was thereupon read a second t and referred to a Select Committee.

RESTORATION OF TH TEMPLE OF NEPTUNI ROME

The Temple of Neptune, in the Piazz Pietra, Rome, near the Pantheon, is restored. Under the Popes, this building first used as a custom house; it is now Stock Exchange Building, and the seat o Chamber of Commerce of Rome. The te has been identified with that of Neptune, in the year 24 B.C., but reconstructed by Ha when he restored the monuments in the of Mars, destroyed by fire in the reign of T It stood within a spacious square bounde all sides by a great arcade, the walls of w were decorated with paintings of the exped of the Argonauts, while before the doors colossal pillars of yellow marble. The te had eight columns in front and fifteen on side, but only eleven columns, belonging t north side of the temple, are extant. enormous columns are now being exposed. in the interior the cell and huge blocks o ancient temple have come to light. Exc tions made in the external part of the bui have also yielded important results, for the of the columns have been discovered, at a d of five metres from the surface. The faca the old temple was ornamented with big st of female figures personifying the various vinces of the Roman Empire. Most of statues, which were unearthed many years in the adjoining square, and are now exhi in the Capitol Museum, will be restored to original places, so that the temple will p assume its old aspect.

BOOK REVIEWS

orgian Details of Domestic Architecture. Selected and photographed by F. R. Yerbury, Hon. A.R.I.B.A. (Ernest Benn, Ltd.) 30s. net.

During recent years many quite important oks dealing with pre- and post-Palladian chitecture in England have appeared, and is book of "details" comes as a welcome pplement thereto. "It is not the inten-n," as Mr. Yerbury says in his three pages introduction, "to add yet another treatise the many already written on that phase of nglish domestic architecture covered by the ther elastic term "Georgian." He leaves e illustrations to speak for themselves after iefly reminding us that, throughout the ntry, and more particularly in London, the icious houses dating from the beginning of e eighteenth century till about 1830 are pidly being replaced by enormous blocks of ildings. Deplorable as these innovations ay ofttimes be, they are obviously inevitable. e writer and photographer who, as in this se, records the still surviving examples of Georgian" architecture renders yeoman ser-ce to the modern architect. There are 150 e plates, quite perfectly reproduced from otographs, and, counting those which are o to the page, they afford us nearly 200 ustrations of single houses, groups of houses d street vistas, together with doorways, bal-nies, iron gateways and railings, mantel-eces, panellings, and other interior fitments, d even a few furnished rooms. The diver-y of sources, geographically, from which ese illustrations are drawn, go far to show e tremendous influence of the fashionable etropolitan architects of the Georgian period buildings in far reaches of the country. Bath, in its fashionable quarters at least, as, and still is, essentially a Georgian city. ith all its modern improvement towards the ntre, the high town is to-day very much as was in its hey-day. Bath as Beau Nash d Beau Brummel saw it was the work of e sophisticated architects who designed hole streets and squares to the orders of althy patrons. Smaller towns and villages re often relied upon the inspiration drawn om the design books, published by such men Batty Langley, William Payn, Abraham ran, and William Halfpenny. This almost atuitous dissemination of architectural ideas s much in the same case as with the de-lopment of country-made furniture of the riod which was influenced by the design oks of Chippendale, Sheraton and Hepple-uite. It is an architectural education to lk up Milsom-street, Bath, to the Circus, ere the tall and stately Georgian houses round the central grass plat with its four ghty plane trees. Windsor, in its outer nge, is essentially Georgian, and that not ly because George III resided there in his stle for the better part of sixty years. Mr. Yerbury's illustrations are, in the ain, of the medium-sized houses in Town d the immediate Home Counties, and of se the country examples are in the lesser nger of demolition, from the mere fact that, general principles, there is scarcely likely be anything better to take their place. orgian Central London is rapidly disappear-g. Many fine old Bloomsbury houses have eady given place to mansion flats, and tall ce blocks, and the same may be said of tricts within the two or three mile radius ch as Kensington, Chelsea, Lambeth, Ken-ngton, and even places east of Aldgate mp. What place-name sounds more un-piring, architecturally, than Stepney? Two nerations ago Stepney Green was considered delectable suburb. Even now, exactly oppo-te Stepney Station on the north side of Com-rcial-road and fairly close to the old parish urch, there is a complete little Georgian burb to and from which, even up to thirty ars ago, self-respecting city clerks journeyed foot or by 'bus to and from their City ices. It may be objected that there is little ticeable beyond their pilastered doorways d rayed fanlights—that they are nothing more than terraced brick boxes with holes for windows. But these brick boxes posses an architectural balance which is always welcome; and scarcely a single Georgian doorway was made that is not likeable to-day. These tidy houses for tidy people, flush with the pavements, have no forecourts or impossible front gardens for the collection of wind-blown rubbish and, being of honest Georgian workmanship, are as habitable to-day as they were a hundred years ago.

The Anglo-American Year Book. (Published by the American Chamber of Commerce in London, at Aldwych House, W.C.2). Price 4 dollars, or 15s. net.

The Anglo-American Year Book for 1927 has made its reappearance and provides an excellent example of the indexing and arrangement of a mine of information on Anglo-American matters. Features of the issue are a preface by the Hon. Horace Lee Washington, American Consul-General in London, statistics reporting on Anglo-American trade in 1926, and there is also an alphabetical Commercial Directory of firms engaged in Anglo-American trade, likely to prove of value to business men engaged in the trade between the two countries.

Spons' Practical Builders' Pocket Book. (London: E. & F. N. Spon, Ltd., 57, Haymarket.) 8s. 6d. net.

This reference book requires no introduction. It suffices to say that this—the fifth edition—is even more comprehensive and useful than its predecessors. The edition has been revised and brought up-to-date, each of the building trades being dealt with separately. Information on special subjects is given under separate headings and all official regulations which affect the carrying out of building work are included, while modern requirements in respect of the construction of factories are summarised. The book is arranged in alphabetical order as before, with extensive cross references and a complete table of contents.

Spons' Architects' and Builders' Pocket Price Book. (London: E. & F. N. Spon, Ltd., 57, Haymarket.) 5s. net.

This handbook, a companion to the "Practical Builders' Pocket Book," is one which architects and quantity surveyors have found indispensable in the past for pricing up materials. Every class of work, bricklaying, masonry, terra-cotta, carpentry, reinforced concrete, plumbing and gasfitting, electric wiring, &c., is included, while there is a very valuable section in which the price per foot cube is given for all classes of building both in London and the provinces. The book is well indexed and of a size suitable for the pocket.

THE BYZANTINE TRADITION

In his final lecture of this session's course on Ancient Architecture for the University of London at the Central School of Arts and Crafts, Sir Banister Fletcher, V.-P.R.I.B.A., followed the current of Byzantine architecture as it travelled from Constantinople in the east to the prosperous city of Venice further west, and to other art centres in Western Europe, where it had survived sporadically down to the present day. Venice, at the head of the Adriatic, was beautified by the devotion of her sons, who were not satisfied with a distant cathedral at Torcello, so, like the Romans, built their place of worship close to the ordinary place of congregation, in their case the Great Piazza of St. Mark's, where arose the great Byzantine Cathedral, like Venice herself, proud, dominating, and magnificent, in a blaze of colour, with its five gilded domes glittering in the sunshine against the blue of the sky. Within, brilliant mosaics told the tale of the creation in the dim, mysterious light that filtered through small eastern windows. Here carving and moulding gave way before the all-pervading colour scheme which sheathed vaults and domes alike, producing a marvellous effect of one harmonious whole.

The speaker referred to the chief monuments of Byzantine art in other lands—Greece, France, and even England—concluding with glimpses of the great Byzantine Cathedral of Westminster, impressive, he said, by reason of its vast internal proportions, and one day to be coated with mosaics in the Venetian manner, which would enable us to realise the generous contribution made by Italy's sun and skies to schemes of decoration. Meanwhile, in north-west Europe architecture of line and form remained of more value than architecture of colour, and was perhaps in better accord with the cold greys of our English climate.

LAW REPORTS

[King's Bench Division.]

(Before Mr. Justice Greer.)

BUILDERS' ACTION FOR ALLEGED LIBEL ON QUESTION OF "WAGE-RATE DEFAULT."

In this action, in which Messrs. Bovis, Ltd., of Upper Berkeley-street, were awarded £25 damages for libel against Mr. Fred Thorne and others of the London Master Builders' Association, Mr. Stuart Bevan, on behalf of the defendants, applied for an order that the costs of the issue of malice should be paid by the plaintiffs to the defendants. He said that the matter was covered by Order 65, Rules 1 and 2. The defendants had pleaded privilege, which was a good defence where the privilege was established, unless it was met by the allegation of malice which the plaintiffs raised.

His Lordship, after hearing arguments on the question which of the parties was entitled to the costs of the issue of malice, on which the jury had found in favour of the defendants, certified that the question of malice in the case was a separate issue in so far as it related to the libels which were published on privileged occasions and that the defendants were therefore entitled to recover their costs of that issue, such costs to be set off against those recoverable by the plaintiffs.

[Chancery Division.]

(Before Mr. Justice Clauson.)

ACTION AGAINST BUILDING OWNER FOR CONTRAVENTION OF BY-LAWS.

The Attorney-General v. Ellis.

This was an action brought by the Attorney-General at the relation of the Uxbridge Urban District Council for a declaration (and ancillary relief) that Mr. James Ellis, of Park Lodge, Uxbridge, by erecting or converting a building abutting on his premises was contravening the by-laws of the Council. The Attorney-General also asked for an injunction to prevent the defendant from allowing the building to remain in its existing form. It was stated that the defendant had converted some stables into two maisonettes, which, it was contended, were buildings within the meaning of the Public Health Acts. The defendant had not deposited the plans as required by the by-laws, and in addition it was urged the buildings were in breach of a number of by-laws.

The defence was that the buildings were not subject to the by-laws and did not come within any statutory definition which would make what the defendant had done a new building or the erection of a new building.

Mr. Justice Clauson held that the buildings came within the meaning of the by-laws and granted the relief claimed in the action with costs.

Auctioneer's Estate.

Mr. Robert Thomas Simpson, J.P., Horringer, Suffolk, carrying on business as an auctioneer and estate agent at Bury St. Edmunds, Attleborough, and Newmarket, left £56,848.

DESIGN AND INDUSTRIES ASSOCIATION

MODERN FRENCH DECORATIVE ART.

Mr. E. W. Hobbs, A.I.N.A., read a paper on this subject to the Design and Industries Association, at 6, Queen-square, on April 5. The lecturer said that his own impression was that the modern movement had its origin in England, was anticipated and preached by William Morris, and was taken to Germany by one of his students—Mathusious—where it developed. It then travelled through Belgium and found early publicity at the Ghent Exhibition in 1913. Frankly, the French did not entirely agree with this, but it was curious that many able critics, men like Albert Levy, Mousignac and others, admitted that it became important during 1913–1914. Then came the war and the oblivion of art. Later came the thankful ending, a return to sanity, and the birth of a new spirit in decorative art, a spirit conceived during a period of unexampled suffering, a spirit stimulated by the physical need for new things to repair the ravages of the battle areas. Behind it all was a desire to *forget the past*, to seek out new ways in peace, to express in wood, in metal, in stone, in a host of new or hitherto unused materials, something of the inmost feelings of a nation scarified by the devastating fires of war. Every European nation had felt the reverberations of that great catastrophe, all had responded in one way or another. It must not be supposed that the war was alone responsible for the modern movement, but it had been the cause in no slight degree for the commercial success of that movement—at least so far as France was concerned. The modern movement was deep-seated, was of great importance. It was more than a casual thing conditioned by exceptional circumstances; it was rather a conscious striving for freedom, for more practical things, things which more fittingly expressed the moods of to-day. In the present day, when luscious foods were served *en route* in mid-air, when floating palaces with the population of a town traversed the oceans of the world, when speech and vision were transmitted with the speed of light, when the scientist had done so much with new materials and with fresh applications of the old, should it be only the artist who lagged behind in the service of mankind? New times demanded new ways. new materials called for a new technique in construction. All these and more had contributed their part to the manifestation called the modern movement. French artists and designers had been very fortunate in one respect, and that was the exceptional publicity accorded to their efforts by the Great Exhibition in Paris during the summer of 1925.

One of the first requirements of that exhibition was that every piece should be new, free of any period style, as if the designers had been marooned on a desert island, devoid of memory, and had created fresh things free from traces of a past age. That exhibition was to many people an expression of something new—was the beginning—whereas it was a gigantic display resulting from the efforts of the previous few years.

It was, however, significant, because at that exhibition—or as a result of it—fresh forces were released in the world—the modern movement was no longer parochial but became a world force. To-day we were beginning to realise some of the inevitable developments of that exhibition. It seemed to the lecturer that there were many lessons to be learnt from Paris, 1925. The modern movement could be likened to a self-conscious child poised on the top of the world, exposed to every wind of criticism, unused to publicity, but endearing, fascinating in its naïvete. We also, as children, should approach the subject with an open mind, with a clear logic, and receptive, but once convinced, full of enduring enthusiasm.

The lecturer emphasised the versatility of the modern French designers relentlessly pursuing their ideals in every sphere of life—in architecture, in great ensembles, in every tiny detail—such as a string of beads, a door knob, a handbag. Always their aim was better things—things to use, to love, to admire, things with that enduring quality which begot the preciousness of a valued treasure.

The lecturer then showed on the screen and described examples of modern French interior decorative art as designed by various exponents, amongst them being Max Blondat, Char Plumet, Dunand, Primavera, Pierre Chareau, Dominique, Francis Jourdain, Maurice Dufrene, Rob Mallet Stevens, and many others. Then, by means of rough sketches, he proceeded to show the manner in which the French designer set to work on a piece. It was not enough to realise merely its purpose—in addition the questions of high lights, position, the style of the room, the tastes of the user—all those matters were gone into very thoroughly, and the piece then designed bearing all those points in mind.

In the discussion that followed Mr. Hobbs's paper, Mr. C. H. James said that from what the lecturer had said, modern French work seemed to be confined to people with incomes of £10,000 a year. In the examples shown, he had noticed the frequent use of strip lights, which, in themselves, were expensive. Mr. Hobbs, in reply to this point, said that while some pieces were undoubtedly very expensive—one small jewel-case he had in mind being priced at £450—in the main prices were reasonable; Chareau, for instance, whose workmen received the present equivalent of 4s. 2d. a day, produced furniture that was quite cheap.

Mr. W. Grimmond said that, in his opinion, the methods of design shown by Mr. Hobbs provided the reason why French furniture was so uncomfortable. It always looked as if it could not be sat down upon at all. The lecturer replied that that criticism might be made of the early work of 1925, but not so now. The French were sensible and would not buy useless stuff.

Mr. Price asked whether the design were incidental to the use or the use to the design to which the lecturer said that the French designer knew exactly what could be done with the material and went straight ahead.

The chairman, Mr. Hamilton Smith, said that, from the standpoint of the D.I.A., interesting as the French work was, its designers had started from opposite poles to those which the English craftsmen had promulgated during the last ten years. He felt that nine-tenths of the value of furniture was its function, and although one could not say didactically that a thing that was useful was of necessity beautiful, there was a great deal of truth in it. The French played up to the luxurious side of life, and had their eye on the exploitation of luxury. In the days of the Louis, luxuries were made largely for the King and the ladies of the rich, and he thought that in France women to-day controlled the mode. Fineness of design should be drawn out by the limitations imposed on the designer, for furniture was primarily a thing of use. He felt that French furniture was a beautiful fungus often producing fine colours, while English design was rather like a tree that had its roots in the nerves of human civilisation. He believed that the French changed their furniture as they changed their clothes. They used æsthetic logic in their design, whereas the English employed the logic of practicability.

In reply, the lecturer said that he could not see that super luxury had anything to do with French design. The cost in the main was not excessively high. The French designer had, as well as the Englishman, the knowledge for what the furniture was intended.

The chairman then closed the meeting with a vote of thanks to Mr. Hobbs, which was heartily accorded.

Dartmouth College.

The Admiralty announce that Mr. E. W. E. Kempson, M.C., B.A., A.M.Inst.C.E., has been appointed Headmaster of the Royal Naval College, Dartmouth. Born on October 22, 1878, Mr. Kempson was educated at Shrewsbury School and Trinity College, Cambridge.

EXHIBITION NOTES

BRITISH WATER COLOURS AT MILAN.

The third biennial International Exhibit of Watercolour Art is being held this spr at Milan, being organised by the two lead art societies of that city, the "Associat of Lombard Acquerellists" and the "Soci of the Fine Arts." The British section, in previous years, has again been entrus to Mr. Selwyn Brinton, F.R.S.A., as de gate, assisted by Mr. Harold Bromhead, acting secretary. A representative collecti of British watercolours, some thirty-five dr ings in all, has now been arranged to exhibited in Milan. The artists c tributing this year include Sir Herb Hughes-Stanton, R.A. (President of British section of this Exhibition), M Russel Flint, A.R.A. (Vice-President), a Hely Smith, William Walcot, Cecil Hu Paul Nash, Moffat Lindler, Claud Fligi Harry Watson, Ethelbert White, and Fra Spenlove-Spenlove are showing in this s tion. The women artists include Mrs. Burleigh; Miss Ethel Walker, who has be recently showing at the Redfern Galler Miss Pauline Konody, who had a very su cessful show this winter at the Brook-stre Galleries, and Miss Bridget Keir, who aga has an exhibition next May at Walker Galleries. Her Majesty Queen Mary, patroness of this British section, has e pressed her interest in the drawings whi are being sent to Milan; and, as on previo occasions, had last week a selection of the sent by command to Buckingham Palace f her inspection.

GOUPIL GALLERY.

The exhibition of sculpture and drawings David Evans at the Goupil Gallery is a m interesting one, for it illustrates very well t ability of this gifted artist. Here is evider of a living force in modern sculpture, whi includes such varied accomplishment as t fine group of rugged labour in the Ro Menders, the refined low relief in Primave some beautiful busts, and an excellently balanc fountain design. Whether in his forcil archaic treatments, his refined low reliefs, or t simple directness of natural forms, this art seems equally at home. He should find ma commissions in decorative sculpture, but in wh ever direction his activities may lead we must ho that his present accomplishments are only t forerunners of an output which shall bring for all the best that is in him. "Prix de Rom sculpture is here exemplified in one of its m distinguished results.

The pictures by Isabel Codrington, at t Fine Art Society's, show the work of a gift artist who essays painting with much succ in a variety of subjects. In some of her st life paintings the treatment could hardly surpassed in tone and colour; her graph expression of strongly-marked portrait stud may look rather over-painted, but they a vivid and good in colour; her landscapes r to quite a high level in some cases; so that h paintings show a remarkable versatility.

New India House.

The construction of the new India House a site in Aldwych, next to Bush House, will be this summer. Plans for the building are neari completion, and Sir Herbert Baker, architect the new Delhi, and Sir Atul Chatterjee, Hi Commissioner for India, are settling final dete of the design. In general appearance the n building will not be dissimilar to Bush Hou so it is said, and any jarring break in archit ture will be avoided. It will be of six or eig stories, will house about 300 persons, and w probably cost about £300,000. Indian wo panelling work will be used for the inter decorations, together with native rugs a ornaments.

THE LONDON BUILDING ACTS AND THEIR APPLICATION.—XIV

By H. V. MILNES EMERSON, A.R.I.B.A.

Section 63.—Means of escape at top of high ildings.

This section in the Act of 1894 has been ealed and section 7 of the London Building ıendment Act, 1905, substituted.

Section 7 of the 1905 Act is as follows :—

(1) Every new building (except a dwelling-ıse occupied as such by not more than one ıily) which is

(*a*) A high building ; or

(*b*) A building in which sleeping accommoda-n is provided for more than 20 persons or ich is occupied or constructed or adapted to occupied by more than 20 persons or in which re than 20 persons are employed or which is ıstructed or adapted for the employment rein of more than 20 persons, shall be pro-ded in accordance with plans approved by the ıncil, &c., with all such means of escape there-m in case of fire as can be reasonably required der the circumstances of the case. (Here low particulars of notices and plans to be ɔmitted to the L.C.C. showing proposed means escape and their consent or refusal of such plication.)

(2) No upper storey in any high building (not ng of the class referred to in paragraph (*b*) of ɔsection (1) of this section and no part of any ilding of the class referred to in the said para-ph shall be occupied or let for occupation til the Council shall have issued a certificate . that such building has been provided with ans of escape in accordance with plans proved as aforesaid by the Council . . . and at the conditions (if any) . . . . have been mplied with.

(3) If by reason of any structural alteration addition of a substantial character of or to y certified building. . . the sleeping accom-ɔdation in such building is substantially in-eased and the risk of fire in such building or e difficulty of escaping therefrom in case of e is thereby substantially increased or if the mber of persons occupied or employed or relling in the upper storeys . . . is sub-ntially increased and the risk of fire . . . e., or difficulty of escaping . . . of if by reason any change of circumstances . . .or if by ıson of any material change in the mode of er of any certified building the risk of fire . or the difficulty of escape is substantially reased . . . then and in any of such events e certificate issued by the Council . . . in pect of such building shall thenceforth be id and of none effect and such building shall nceforth cease to be a new building and be emed to be an existing building.

(4) Nothing in this section contained shall thorize the Council to require (in the case a building being a high building and not ng a building of the class referred to in ragraph (*b*) subsection (1) of this section any ans of escape from any storey other than an per storey.

Section 9.—Protection against fire in certain sting buildings. . . . Any existing building cept a dwelling house occupied as such by more than one family) which is—

(*a*) A high building ; or,

(*b*) A building in which sleeping accom-dation is provided for more than 20 persons which is occupied by more than 20 persons n which more than 20 persons are employed Council if in their opinion such building is provided with proper and sufficient means escape therefrom in case of fire, may at any e serve on the owner of such building a ice requiring him to provide such means of ape as can be reasonably required under the umstances of the case.

ny such notice shall specify in detail the uirements of the Council and the owner, . . . (shall execute such works, or can eal, or submit alternative proposals).

(2) This section deals with penalties, etc.

(3) The Council shall keep at the County Hall a register . . . . of all orders made under this section.

(4) Nothing in this section contained shall authorise the Council to require in the case of a building (being a high building and not being a building of the class referred to in paragraph (*b*) of subsection (1) of this section) any means of escape from any storey other than an upper storey.

Factory and Workshop Act, 1901.

Provision of Means of Escape in Case of Fire.

Section 14.—(This Act provides means of escape from factories, etc., and can be enforced by the L.C.C.)

(1) Every factory erected after January 1, 1891, in which more than 40 persons are employed and every workshop erected after January 1, 1896, and in which more than 40 persons are employed must be furnished with a certificate from the district council of the district in which the factory or workshop is situate . . . is provided with such means of escape in case of fire . . . as can reasonably be required under the circumstances of each case, etc.

(2) With respect to all factories and workshops to which the foregoing provisions of this section do not apply and in which more than 40 persons are employed . . . the district council concerned must from time to time ascertain that such premises comply with this Act and gives power to owner to carry out such requirement notwithstanding any agreement with occupier.

(3) In case of a difference of opinion between the owner of the factory or workshop and the Council the difference can be referred to arbitration under the terms set forth.

(4) Provides as to how cost is to be contributed by owner or occupier.

(5) Provides for enforcing the foregoing provisions of this section.

(6) The means of escape in case of fire provided in any factory or workshops shall be maintained in good condition and free from obstruction, etc.

(7) For the purposes of this section the whole of a tenement factory or workshop shall be deemed to be one factory or workshop and the owner shall be substituted for the occupier.

(8) How expenses incurred by Councils are to be defrayed.

15. By-laws for means of escape from fire. Every district council shall in addition to any powers which they possess with reference to the prevention of fire have power to make by-laws providing for means of escape from fire in the case of any factory or workshop and sections 182 to 186 of the Public Health Act, 1875, shall apply to any by-laws so made.

16. Doors of factory or workshops to open from inside. (Doors, excepting sliding doors, shall open outwards and shall not be locked during working hours.)

The Factory and Workshop Act, 1907, extends the Factory and Workshop Act, 1901, so as to include laundries and other institutions

Section 1, subsection 29.—Laundries carried on by way of trade or for the purpose of gain or carried on as ancillary to another business or incidentally to the purpose of any public institution.

Section 5 (1).—Where in any premises forming part of an institution carried on for charitable or reformatory purposes and not being premises subject to inspection by or under the authority of any Government department any manual labour is exercised in or incidentally to the making altering repairing ornamenting finishing washing cleaning or adapting for sale of articles not intended for the use of the institution the provisions of the principal Act shall subject to the provisions of this Act apply to those premises notwithstandisg that the work carried on therein is not carried on by way of trade or for the purpose of gain or that the persons working therein are not working under a contract of service or apprenticeship.

SUGAR BEET FACTORIES

At a meeting of the Surveyors' Institution, held on April 11, Mr. G. Turville Brown read a paper on "The British Sugar Beet Industry," in the course of which he gave a short description of a typical beet-sugar factory. The bulk of the sugar produced in England at present, he said, was manufactured by what was known as the diffusion process. The size of such a factory varied from a capacity of 600 to 700 tons a day of beet up to 1,500. A typical factory of this kind would require a site of 60 to 80 acres on which would be placed the main factory containing all the essential machinery for the working and slicing of the roots, for the diffusion of juice from the slices, for the purification of the juice, and the boiling and subsequent crystallisation of the sugar. There would be a large sugar store where the finished product would be delivered, and which would be under the charge of a Custom House official, without whose certificate that the duty has been paid, no sugar would be able to be removed. There would also be, separate from the main factory, a large building for the drying of the pulp and the storage of the dried pulp in bags, and metal or concrete molasses tanks of adequate size. The site also would contain the beet flumes on which the raw beet as brought in by rail, road or water, would be placed, the sidings for the use of the railway company and of the sugar company, and the settling ponds wherein the lime used in purification, and the earth brought in on and washed off the raw beets, would be settled before the clear effluent was turned back into the nearest watercourse.

The first essential to be taken into account was the suitability of the site as a centre of beet supply. Every shilling of cost for rail, road or water carriage was a matter of great importance, and it was therefore desirable that factories should be placed in centres where the necessary beet would be grown as close to them as possible. It was probable that a radius of 25 miles from the factory was as far as should be counted upon. The site of the factory should be level and free from roads, footpaths and rights-of-way across it. It should have a long frontage to a railway in a position where the railway company could work the traffic easily and, if possible, at a point where signalling facilities were already established. An important point was that the site should adjoin, or be in close proximity to, a good main road. It was highly essential that the foundations provided should be above suspicion, as the effects of a bad settlement might be disastrous. The weight of the buildings and machinery was very considerable, and in some of the factories there were steel stanchions each carrying a load of 150 tons. There were many miles of piping containing steam or liquid under pressure.

Water supply for a factory of 1,500 tons a day should not be less than 3½ million gallons a day, though it was possible to reduce this amount by using the beet-washing water twice or three times. Of this quantity about 400,000 to 500,000 gallons would be required for process purposes, the remainder being for washing only. For process purposes fresh water of good quality was needed, but for washing beet it had been found possible to use a slightly brackish water. Effluent from a sugar factory required special treatment. Factory-owners were giving this matter their most careful consideration.

Town-planning Council.

The National Housing and Town-planning Council has arranged a series of regional conferences of local authorities in different parts of England and Wales. The centres to be visited are London, Manchester, Leeds, Newcastle-upon-Tyne, Birmingham, Nottingham, Plymouth, Bristol, Portsmouth, Cambridge, Cardiff, and Llandudno. Subjects to be considered include the administration of the Housing Acts, the maintenance of good standards of planning and design, slum problems, rural housing, the preservation of rural England, and town and regional planning.

ARCHITECTS' & BUILDERS' INQUIRY BUREAU

We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters.

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or, better still, in typewriting?—Ed.

Trench Excavation.

Sir,—What is a fair price for excavating a trench per yard, and is this measured solid or taken as 1½ yds. per yard after dug? The trench in question is 72 yds. long, 12 ft. wide at top, and 2 ft. wide at bottom. At one end was a hedge 66 ft. long, which has been taken down and roots grubbed up for 30 ft.; remainder chopped off level with ground. There was an oak tree at the other end of trench which has been taken out. The tree was about 25 ft. high and 1 ft. diameter.

W. H. E.

[The custom is to measure the trench *rett* at per yard cube. To dig and throw out, say, 2s. 6d. yd. cube. To fill into barrows and wheel and deposit, say, 50 yds. run, 1s. to 1s. 3d. per yd. cube. Get a timber merchant to buy the oak tree and cut it down. Allow extra for grubbing up the roots, say, £3 to £5. The small roots must be valued in the site. If the sides of the trench are to be "trimmed," allow 4d. to 6d. per yd. super.]

Design of Roof Trusses.

Sir,—Would one of your correspondents be good enough to let me know of any text book giving simple arithmetical methods for the calculation and design of roof trusses, more particularly for steel trusses for buildings of, say, 30 ft. to 60 ft. span?

Assistant.

Rule of Thumb for Pricing Timber.

Sir,—Each of your two correspondents on this subject, in your issue of March 25, makes a slight error. To find the price per cubic foot from the price per standard, Mr. Barron should deduct 1 for every 33, not 32.

Example.— £22 per standard (2s. 8d
add ½ 11 cub. ft. exactly)

33

Deduct 1 for every 33—

1

—— = 2s. 8d. per cub. ft. exactly.

32d.

In pricing a foot lineal of any scantling given the price per standard, Mr. Atkinson should add, for "absolute accuracy," 1/99th, not 1 per cent.

Example.—6 in. by 2 in. at £33 per standard (4d. per ft. lineal exactly)—

Method	.33
Multiply by 6 by 2 = 12	
	3.96
Add 1/99th	.04
	4.00 per ft. lineal.

This latter arises from the fact that 240 (number of pence in £1) × 99 = 23,760, which is the number of feet lineal of 1 in. by 1 in. in a standard.

These errors do not, of course, affect the practical value of the methods explained. I simply point them out as a matter of academic interest.

Ivor R. Edwards, L.I.O.B.

Dampcourse.

Sir,—I have recently observed a block of houses in course of erection in which there was no dampcourse. The construction was in well-made concrete blocks 6–1 and bedded in lime mortar gauged with a little cement. In course of conversation the builder assured me of his confidence that the construction was sufficiently non-porous to justify the omission, but I have grave doubts upon the subject. Have any of your readers come across a similar treatment in modern work, and, if so, have there been any bad results?

Thomas.

Oak Sills.

Sir,—Is there any sound measure to be taken to prevent oak sills splitting with the weather, when the finish is not to be paint but a preserving stain? I think it is almost impossible to get oak of any bulk in section which will not split under the hot sun.

Question.

Penalty Clause.

Sir,—I have been informed that any variation on the building contract, however slight, has the effect of vitiating the contract as far as the time limit and penalty are concerned. If this is correct it would account for the phenomenon that in twenty years' experience I have never known a penalty enforced; but I should like to know if it is indeed correct?

Speed-up.

Malting Buildings.

Sir,—I should be grateful if any of your correspondents could refer me to an up-to-date text book upon the subject of maltings and malting practice. I have old text books upon the subject, but have no doubt that science has advanced in this as in other trades, and that there is much to be learnt to bring matters up-to-date.

Planner.

Returning Bills of Quantities.

[Reply to "Irregular," April 8.]

Sir,—It is not irregular for an invitation to tender to contain a stipulation that the tender must be accompanied with the bills of quantities fully priced out. Its object is, obviously, to compare and analyse the unit prices of the various tenders before one is accepted. It must be remembered that an invitation to tender is an offer to receive offers only, and however unreasonable a stipulation may be, since no legal liability attaches to the invitor if no tender is accepted, it follows that if the bills of quantities are detached as suggested "Irregular" has no legal remedy if the invitor fails to consider his estimate Also he is under no legal liability if he detaches the bills of quantities, though, as pointed out, he risks his tender not being taken into consideration by non-fulfilment of the conditions of the invitation to tender.

Law.

THE WEEK IN PARLIAMENT

Westminster, *Wednesday.*

Leasehold Reform.

The Landlord and Tenant (No. 2) Bill, which contains the Government's new proposals for leasehold reform, has been read a second time in the House of Commons by 240 votes to 83. It was opposed by the Labour Party, who contended that its provisions did not go far enough, and that it should apply to all premises. The Solicitor-General, replying on behalf of the Government, said that all reasonable suggestions would be welcomed and would be favourably considered in Committee.

Sir W. Joynson-Hicks, the Home Secretary, who introduced the Bill, said that the leasehold system, when worked by an ideal landlord, was very largely an ideal system. But there were—and that was the reason for the Bill—cases where an unscrupulous landlord was prepared to take advantage of the position of the tenant, in particular when the time came for the making of an alteration to the premises, or the renewal of his lease. The object of the Bill was to put all landlords in the same category as the ideal or good landlord. There were restrictions imposed by landlords on the development and improvement of leasehold property which, in the twentieth century, the Government thought should not be imposed. There were, in many leases, covenants forbidding structural alterations, without the consent of a landlord. The Bill proposed that on all such questions the tenant might appeal to an independent tribunal. The tenant would, in fact, be protected by the Bill against the action of a harsh or unconscionable landlord either in regard to goodwill or improveme or restrictive covenants.

Protecting the Countryside.

Mr. Day asked the Minister of Trans whether, in view of the disfigurement of English countryside by the erection of pe pumps in excess of the needs of motor users would suggest action to the local authorities v a view to this form of annoyance being abat

Colonel Ashley said he fully sympathised v the hon. member's objection to any disfig ment of the English countryside, but he did think that any Government Department or l authorities generally had power to prevent erection of petrol pumps on private property the ground of disfigurement. So far as cerned their erection on land dedicated to highway his views were contained in a circ which he caused to be sent to all high authorities some time ago.

Mr. R. Young asked the Minister of He whether he had received resolutions from r district councils requesting that power be gi to them and other local authorities to refer b or to reject plans of buildings presented to t for their approval which threaten the beaut the countryside; whether the matter received consideration; and what answer been sent to the petitioning authorities.

Sir H. Barnston said that resolutions fro number of rural district councils had received. It was possible at present for l authorities to obtain certain powers under t planning schemes for preventing the erectio disfiguring buildings. Legislation would required for any wider action, and the Mini could not promise to undertake that at present time.

Rural Housing.

Major Glyn asked which were the cou councils that had put into force the Hous (Rural Workers) Act.

Mr. Chamberlain said that draft sche under the Act had so far been submitted by county councils and had been provision approved. A further 26 county councils schemes actually under consideration, but t had not yet been submitted for approval. following were the county councils which received approval to draft schemes under Housing (Rural Workers) Act, 1926:—Angle Carmarthen, Cumberland, Kent, Lin (Holland), Lincoln (Lindsey), Somerset, Sur Sussex (East), Worcester, Yorks (East Ridi Yorks (North Riding).

Building Societies and the Subsidy.

Lord H. Cavendish-Bentinck asked Minister of Health whether he had consid the cases of those public utility societies wh for the purpose of providing houses for the p limited the interest payable on their shares loan stock to 2½ or 3 per cent.; and whethe view of the fact that the whole of the capit these societies had to be raised by subscript he would consider making an exception in t favour when the housing subsidy was reduce October, 1927.

Mr. Chamberlain said that he was aware of efforts which were being made by var philanthropic bodies to provide houses at rentals for the poorer section of the commu and he was of opinion that those efforts worthy of every encouragement. He had power to make such an exception as Lor Cavendish-Bentinck contemplated. He w anticipate, however, that the reduction of sidy would result in a reduction of prices so the activities of those bodies would be facilit rather than prejudiced.

The House Shortage.

Mr. Gibbins asked for the latest figure houses required to meet the present short

Sir K. Wood said that reliable figures a the present shortage of houses were not a able, but the present annual rate of h construction was, in the opinion of the M ter, very much in excess of the normal an requirements, and considerable progress therefore being made towards overta arrears.

THE BUILDING TRADE

BY-LAWS RELATING TO BUILDINGS AND STREETS.—XV

n these articles we have been only able to ch upon certain points contained in the ort of the Committee on Building By-laws, it may be of service to give the Summary Recommendations contained in the Report, h references to the observations contained n them in these articles, but there is a e to the recommendations set out in the mmary which we give first.

fter stating that in Chapter IX it is in- ded to summarise the recommendations, the ort proceeds: "First reiterating that both the drafting of their model series and by ir practice in revision and confirmation of laws made by local authorities the Local vernment Board (now the Ministry) have our opinion done as much as can be done ler the existing law to avoid hardships and iculties in the control of building and de- opment and that such improvements as are uired in the system can in consequence be ried into effect only after legislation. It l be seen that almost every one of our sug- tions involves legislation and that most of m are for alterations in the machinery of trol by which it may be brought up to date l put in order, our view being that no olutionary changes have been shown to be irable."

The Recommendations.

1) That the statutes in the general law horising the making of by-laws be con- idated (Para. 17, Art. II).

2) That any obvious gaps in the existing vers be stopped up and clear deficiencies be nedied (Paras. 12 and 17, Art. II).

3) That in particular the existing statutory initions of "new building" be taken into nsideration with a view to such an amend- nt as will secure that works which cannot sonably be subjected to the control properly plied to the erection of a new building are classed as such (Paras. 16 and 17, Art.).

4) That certain powers relevant to the sub- t of our inquiry which have been incor- rated in common form clauses in local Acts made available in the general law (Paras. and 100, Art. IV), and that the existing ctice of Parliament not to give special local vers for purposes which can be secured by laws under the general law be maintained ra. 98, Art. IV).

5) That all sections in Acts of Parliament ing powers with respect to new streets and ldings should, so far as possible, take the pe of authorising by-laws to be made; that relation to the control of streets and build- s by-laws made by the local authority and firmed by the Ministry should be recog- d as the standard method of control to the lusion (unless by-laws are clearly the less ropriate method) of direct statutory pro- ons, of discretion, and of regulations ra. 21, Art. IV), and that where Parlia- nt is satisfied that new local Act powers essential they should, whenever possible, in the shape of a by-law-making power. t local Act sections within our terms of rence be required to be printed and sup- d without charge as by-laws are (Para. 98, IV).

6) That when a clause in this shape is wn to the satisfaction of the Local Legis- on Committee to be unsuitable, any powers n with respect to new streets and build- s should be limited in point of time with er to the Ministry to extend the time by er (not provisional) (Para. 101).

7) That regulations, as distinct from by- s, be abolished in matters within our terms eference (Para. 22, Art. IV).

8) That the distinction between urban orities and rural authorities in respect of their by-law-making powers be abandoned, leaving it to the Ministry, under section 184 of the Public Health Act, 1875, to refuse to allow unnecessary or unsuitable by-laws proposed by an authority of either class (Paras. 14 and 15, Art. III).

(9) That in the Act for the foregoing purposes, when it has enumerated the specific topics on which it is considered by-laws should be made, there should be a section giving power to the Ministry to add other topics by Provisional Order, as they can now do when a specific by-law-making power is given in a local Act (Para. 17, Art. II).

(10) That section 44 of the Housing, etc., Act, 1909, which gives the Ministry power in certain circumstances to require the repeal of an existing by-law, be amended so as to get rid of the words which have prevented the power from being an effective one; the power being at the same time so extended that advantage may be taken of it in relation to other buildings as well as houses for the working classes (Para. 35, Art. V).

(11) That a time limit, according to their date of confirmation, be put on the continuance of all by-laws coming within our terms of reference, including those to be confirmed hereafter (Para. 35, Art. VI).

(12) That in order to facilitate the amendment of existing local Act provisions within our terms of reference, the Ministry be given power, after a local inquiry, to make amending Orders which in the absence of opposition need not be provisional (Para. 104). That where it is desired merely to repeal a local Act section for the purpose of replacing it by a by-law to the making of which the section is an obstacle, local inquiry may be dispensed with and the repeal may be effected by a provision included in the certificate of confirmation of the by-laws (Para. 106).

(13) That a local authority who reject a plan should be required to specify in writing the particular respect in which its carrying out would be illegal (Para. 39, Art. VI).

(14) That on a joint request from the local authority and the person whose plan has been rejected, the Ministry be empowered to decide (subject to the power to state a case for the High Court if the Ministry see fit) whether the rejection is or is not lawful; that any such decision be binding on both parties, and on any Court before which the question whether the particular plan complies with the law may come (Para. 40, Art. VII).

(15) That failing an agreement to refer the legality of the rejection to the Ministry, either party be given the right to apply to a Court of summary jurisdiction with appeal to Quarter Sessions for a declaration whether the rejection was or was not lawful; that any declaration so obtained be binding except in the High Court (Para. 43, Art. VII).

(16) That in relation to by-laws as to the level width and construction of new streets, binding force should be given to conditions embodied in the by-laws (*e.g.*, in urban model clause 6) and adopted by the developing owner under which he has obtained the benefit of a reduction of the general requirements of such by-laws (Para. 68, Arts. XII, XIII, XIV).

(17) That by-laws be authorised for fixing the distance between the buildings in new streets, and that the Public Health (Building in Streets) Act be repealed (Para. 68, Arts. XIII, XIV).

(18) That power be given to prevent a street once laid out in accordance with the by-laws from being altered in such a way that if at first so made it would have contravened the by-laws (Para. 72, Art. XIV).

(19) That clauses with respect to new streets should so far as practicable include provisions to secure that at the stage of laying out some construction work of at least an elementary character be done (Para. 64, Art. XI).

(20) That following on this, local authorities should in relation to the taking over of a street under section 150 of the Public Health Act, 1875, or under the Private Street Works Act, 1892: (i) be required when putting forward their constructional by-laws to formulate in advance a maximum specification or specifications on compliance with which or with the appropriate one they will take over streets and that such specification should be submitted for the approval of the Ministry under section 184 of the Public Health Act, 1875, in the same manner as a by-law (Para. 65, Art. XI); (ii) not be allowed to require at the stage of taking over the destruction of work executed in accordance with the by-laws or with such specification at the stage of laying out and still in good condition (Para. 64, Art. XI).

(21) That it be made the duty of every local authority to adopt at least some building by-laws, and that periodical returns be made to the Ministry of the number of plans submitted in accordance therewith; that machinery be introduced whereby in default of the making of necessary by-laws the Ministry may put in force by Order provisions which shall have effect as if they were by-laws made by the authority (Paras. 108 and 109, Art. IX).

(22) That if a local authority makes default in the enforcement of by-laws the Ministry shall have power as they already have in London with regard to by-laws made under the Public Health (London) Act, 1891, to appoint the County Council to execute the by-laws in place of the local authority (Para. 110, Art. IX). That if a local authority neglect or decline to enforce a particular by-law in a proper case, the County Council or any ratepayer or inhabitant of the district be empowered to take proceedings to enforce it, suitable provision being made as to the reimbursement of costs (Para. 116, Art. IX).

(23) That the existing exemption in the model by-laws in favour of buildings erected under the Improvement of Land Acts be deleted, and, as by-laws are revised, be gradually swept away (Paras. 83, 84). That the other existing exemptions in favour of buildings in which various Departments of the Government are interested be reconsidered, and be made, where necessary, the subject of negotiation with the Departments concerned with the object of securing that as a rule all buildings, even if erected by a public body for a public purpose, shall come within the purview of the local authority. That no new exemption be given in favour of buildings erected in accordance with plans approved by any Government Department (Para. 94). That the existing exemptions be revised so as to secure if possible compliance with drainage and certain other necessary by-laws (Para. 94).

We have set out the summary of recommendations as given in the Report in full, with references to the paragraphs in the Report and also reference to those recommendations we have discussed in these articles, as it may form an index to the paragraphs discussed in these articles, although it will be seen we have by no means touched upon all the paragraphs in the Report. But it must be observed that the summary contained in the Report does not cover all the recommendations in the Report. For instance, no mention is made in the summary of the recommendations contained in Paragraph 113 as to how in every district progressive by-laws are to be secured, which we set out in our ninth article.

We must conclude this series of articles on the same note we sounded in our introductory article; they have been written in no dogmatic spirit, and any observations or suggestions we have made have been put forward tentatively to invite discussion. The whole subject bristles with difficulties, and our wish has been to revive discussion on the valuable Re-

port of the Committee on Building By-laws rather than to attempt any criticism of a document of such weight. Sooner or later the Public Health Acts are certain to be consolidated and a settlement of the questions raised in this Report should precede consolidation. Indeed, we think the most convenient course would be to deal with the by-law questions as soon as possible in a separate Bill, which, even if it did not pass into an Act, would secure the subject being cut and dried before consolidation actually is effected.

We are conscious that we have performed the task we set out on very imperfectly, but we shall feel we have accomplished something if the result of these articles is to rescue from the oblivion of the pigeon-hole, and invite discussion upon, one of the most carefully prepared and valuable Reports any Departmental Committee has ever produced.

DEVELOPMENT OF URBAN SITES

In the course of a paper on "The Economics of the Land," read before the Auctioneers and Estates Agents' Institute on March 31, Mr. David M. Lawrance, B.Sc., said a practical consideration of prime importance in relation to urban site rents was the extent to which the land might legally be developed. We should in many cases arrive at a purely fictitious estimate of economic rent if we assumed that every site could necessarily be developed in the most profitable manner. The terms of a restrictive covenant or the provisions of a town-planning scheme, for example, might restrict the uses to which the land might be put and prohibit the erection of that type of building which would best exploit its possibilities. If land could only legally be used for agricultural or accommodation purposes, that was the user which determined its economic rent, however ripe it might be for the erection of house or shop property. Similarly, the existence of an easement would affect the economic rent of a site by reason of the restriction it might impose on development. The whole question of the effect of private contracts and legal enactments on urban site rents offered a fascinating subject for research. A single example from the immediate present might serve to illustrate the practical issues involved. As from January 1, 1926, the Law of Property Act, 1925, had afforded a means for securing the release of lands from obsolete and unreasonable restrictive covenants, the modification or removal of which involved no real hardship to those entitled to the nominal benefit of them. The effect of this provision must be that in many cases land which was formerly restricted to a type of user quite unsuited to it under present conditions was now capable of development for purposes which exploited its situational advantages to the full. A certain element of value latent in the land had been released from the artificial restrictions which formerly prevented its realisation. What would formerly have been a purely theoretical view of the economic rent had been converted into a practical estimate of the present annual value of the site. It was possible that in many cases this vital change had passed unnoticed, or at any rate unexploited. There had, as yet, been little experience of the operation of the Act. Landowners and speculators might be slow to realise its possibilities or disinclined to put them to the test. But it was not, he thought, taking too theoretical a view of the matter to suggest that in all cases to which section 84 of the Act had any real application there already existed an increase in economic rent which it required only the procedure prescribed by the Act to realise in terms of market value.

Institution of Electrical Engineers.

The summer meeting of this institution will take place at the North-Eastern Centre, Newcastle-upon-Tyne, from June 14–17, 1927. Full particulars may be obtained from Mr. P. F. Rowell, Secretary, Institution of Electrical Engineers, Savoy-place, W.C.2.

THE TRADE UNION AND TRADE DISPUTES BILL

The Government have introduced a Bill to amend the law relating to Trade Unions and Trade Disputes, and although it is certain to arouse opposition and to be the subject of controversy, we think it will be found to be a moderate measure, especially if a broad view is taken of its provisions, that is to say, if the evils it is intended to remedy are kept in sight, and those who oppose it are asked the simple question whether the converse of its provisions are either fair or desirable.

Clause 1, subclause (1), is as follows: "It is hereby declared that any strike having any object beside the furtherance of a trade dispute within the trade or industry in which the strikers are engaged is an illegal strike if it is a strike designed or calculated to coerce the Government or to intimidate the community or any substantial portion of the community, and that it is illegal to commence or continue, or to apply any sums in furtherance or support of, any such illegal strike. For the purposes of the foregoing provision a trade dispute shall not be deemed to be within a trade or industry unless it is a dispute between employers and workmen or between workmen and workmen in that trade or industry which is connected with the employment or non-employment or the terms of the employment or with the conditions of labour of persons in that trade or industry." We know that it is claimed in some quarters that the general or sympathetic strike has been legal for some period before the passing of the Trade Disputes Act, 1906, but that this is not the case we think can be proved by the fact that in that Act it was thought necessary to introduce words which would legalise it, as that Act, as is well known, was inspired by the Labour Party.

Section 3 of the Conspiracy and Protection of Property Act, 1875, provides: "An agreement or combination by two or more persons to do or procure to be done any act in contemplation or furtherance of a trade dispute between employers and workmen shall not be indictable as a conspiracy if such act committed by one person would not be punishable as a crime"; there was no definition of what was a "trade dispute" and it is strong evidence that this Act was only considered to apply to disputes between workmen and their employers, or as the Bill puts it, "disputes within the trade or industry in which the strikers are engaged," and it was found necessary to introduce a definition of "trade dispute" in the Trade Disputes Act, 1906, which would embrace a strike outside those limits.

Section 5, subsection (3), defines the expression "trade dispute" as follows: "In this Act and in the Conspiracy and Protection of Property Act, 1875, the expression 'trade dispute' means any dispute between employers or workmen, or between workmen and workmen, which is connected with the employment or non-employment or the terms of the employment or with the conditions of labour of any person, and the expression 'workmen' means all persons employed in trade or industry, *whether or not in the employment of the employer with whom a trade dispute arises*; and in section 3 of the last-mentioned Act the words 'between employers and workmen' shall be repealed." These latter words, "whether or not in the employment of the employer with whom a trade dispute arises," form the charter of the general or sympathetic strike, and it is since the passing of that Act that it has come into being.

The nation, including the Trade Unions, has recently experienced a general strike and is still suffering from the effects of it most seriously; and on this subsection what has to be considered is whether the converse of this clause indicates a desirable state of affairs—that is to say, that the law should be "a strike is legal even if it is designed or calculated to coerce the Government or to intimidate the community or any substantial portion of it and it is legal to supply sums for the purpose."

Subclause (2) renders any person who declares, instigates, furthers or takes part in a strike declared in subsection (1) to be illegal liable on summary conviction to a fine not exceeding £10 or to imprisonment for a term not exceeding three months, or on conviction on indictment to imprisonment for a term not exceeding two years. Subclause (3) declares that the provisions of the Trade Disputes Act, 1906, shall not, nor shall the second proviso to subsection (1) of section 2 of the Emergency Powers Act, 1920, apply to any act done in contemplation of furtherance of a strike which is by this Bill declared to be illegal, and any such Act shall not be deemed for the purpose of any enactment to be done in contemplation or furtherance of a trade dispute.

In the Trade Disputes Act, as well as the Conspiracy and Protection of Property Act, the immunity for acts done depends upon the act having been done "in contemplation or furtherance of a trade dispute," but section 4 of the Trade Disputes Act, which prevents any action for any tortious act being entertained in any Court as against a trade union or any of its members or officials thereof, is without this limitation (Vacher & Sons *v.* London Society of Compositors, 1912, A.C. 107; *The Builder*, November 22, 1912); the above subclause therefore appears to touch section 4 of the Trade Disputes Act to this extent, that if a tortious act is committed in a strike declared illegal by subclause (1), then a civil action can be entertained in the Courts for the wrong committed; but we think it is evidence of the moderation shown in this Bill that except in this one particular the immunity from action granted by section 4 to trade unions and trade unionists alone out of the whole community has been left untouched.

The mention of the Emergency Powers Act appears to have been introduced solely to prevent controversy. The somewhat extraordinary contention has recently been put forward that the Emergency Powers Act, which enables emergency orders to be made to secure the essentials of life to the community when they are threatened by any body of persons, legalises the general strike, because it also provides that no such regulation shall make it an offence for any person to take part in a strike.

Clause 2 of the Bill relates to what may be called victimisation. No person refusing to take part in any strike which by the Act is declared to be illegal shall be by reason of such refusal or by reason of any action taken by him under this clause subject to expulsion from any trade union or society or to any fine or penalty, or to deprivation of any right or benefit to which he would otherwise be entitled, or liable to be placed in any respect either directly or indirectly under any disability or at any disadvantage as compared with other members of the union or society or anything to the contrary in the rules of a trade union or society notwithstanding.

Granted that a strike is illegal which is designed to coerce the Government or to intimidate the community as laid down in clause 1, it follows that some protection is reasonable for persons who refuse to take part in an illegal act when those persons are members of a trade union and subject to certain discipline by such societies. Subclause (2) of this second clause provides that no provision of the Trade Union Acts, 1871 to 1917, limiting the proceedings that may be entertained by any Court, and nothing in the rules of a trade union or society requiring the reference of disputes to arbitration, shall apply to any proceeding for enforcing any right or exemption secured by this clause, and in any such proceeding the Court may, in lieu of ordering a person who has been expelled from membership of a trade union or society to be restored to membership, order the

e paid out of the funds of the trade union ociety such sum by way of compensation mages as the Court thinks just.

e may mention that in the above citation e Acts, the Trade Disputes Act, 1906, is ded, as it can be cited as one of the e Union Acts. This subsection is neces- to give the Courts jurisdiction, for under Trade Union Acts, generally speaking, the ts at present have no jurisdiction over we may term domestic matters of the ns.

e see it is already asserted that this Bill create class ill-feeling, but there is no ion of class about it; the provisions we just noted are intended to afford protec- to members of the same class and to e them freedom of action. In this con- on it may be interesting to see what was iew of the Liberal Attorney-General when Trade Disputes Act was first introduced Bill. He characterised section 4 of that which prevents an action for a tortious being brought against a trade union or its bers as "a proposal to create class privi- , an inconsistent policy for a democratic rnment to adopt." It is against the ests of anyone that any body of persons ld be placed in a position outside the law, it is against the interests of the members ose societies as much as if not more than ne else. A body placed outside the law e first to victimise its own members, but law recognises no class, and therefore is greatest instrument for securing equality een all classes.

order to understand clause 3, it is neces- first to refer to the Conspiracy and Law roperty Act, 1875: section 7 (4) of that makes it an offence for a person with a view mpelling any other person to abstain from g or to do any act which such other person a legal right to do or to abstain from g to "watch or beset the house or other e where such other person resides or car- on business or happens to be, or the ap- ch to such house or place," but the last graph in the section contained a provision o attending at or near such places for the poses of giving information. This last graph was repealed by section 2 of the de Disputes Act, 1906, which is as follows: shall be lawful for one or more persons g on their own behalf or on behalf of a trade n or of an individual employer or firm in emplation or furtherance of a trade dispute ttend at or near a house or place where rson resides or works or carries on busi- or happens to be, if they so attend merely the purpose of peacefully obtaining or municating information or of peacefully uading any person to work or abstain from cing."

ause 3, subclause (1), of the Bill makes this wful if the persons attend in such bers, or otherwise in such manner, as to alculated to intimidate any person in that e or place, or to obstruct the approach to or egress therefrom, or to lead to a ch of the peace; and attending at or near house or place in such numbers or in such anner as is by this subclause declared to nlawful shall be deemed to be a watching besetting of that house or place within neaning of section 7 of the Conspiracy and of Property Act, 1875.

bclause (2) contains the following defini- of the expression "to intimidate." It us "to cause in the mind of a person a nable apprehension of injury to him or y member of his family or of violence or age to any person or property, and the ession "injury" includes injury other physical or material injury, and accord- the expression "apprehension of injury" des an apprehension of boycott or loss of kind or of exposure to hatred, ridicule or empt." This interpretation of the ex- ion "intimidate" is also to apply to the piracy Act. By subclause (4), watching besetting by one or more persons is made al. "Peaceful persuasion," as was fore- from the first, is a contradiction in terms has led to intimidation, but this clause seems clumsily drawn and no doubt will receive attention in Committee, as it is roundabout.

Political Funds.

Clause 4 introduces a change in the law as regards contributions to the political funds of a Trade Union. As the law stands, any member who desires not to contribute to such funds has to give notice that he desires to be exempted from the contributions; the clause reverses this process and the political contribution can only be levied on those members who have intimated a desire to contribute to the political funds. This, no doubt, will prove one of the most contentious clauses of the Bill, as it is always difficult to curtail privileges that have been acquired, but regarded from the point of view of abstract justice, nothing appears to be said against this change. As we pointed out in a recent article on Unemployment and Industrial Unrest, in our issue for December 31 last, originally the Trade Unions created the Labour Party, and they contributed funds to "solidify Labour," but since those days the Labour Party has become a recognised political party with all the machinery attaching to a political organisation and one which has held office and with a policy definitely put before the electors at the polls, whilst the Trade Unions since 1913 have become political bodies. The Trade Unions, as industrial bodies, have disciplinary powers over their members and their rules regulate the terms on which men can obtain employment, and a breach of those rules may prevent him from obtaining employment as a free agent. The political levy has become part of the organisation of the Trade Unions, and a man openly dissociating himself from the political objects of his union may become a marked man. The Bill places him in the position of every other elector; if he desires to contribute to a political fund he can intimate his desire to do so, and not, as at present, take active steps in his industrial organisation to dissociate himself from a subscription levied as a matter of business from all members alike. Here, again, if we state the converse of the proposition, the position becomes clearer. To obtain a livelihood a man must belong to a union and observe its rules; must he, on joining a union, declare his political opinions and express a desire not to contribute to a fund, part of the organisation of that body? In no other walk in life has a man to declare his political opinions in connection with an organisation essential to his being allowed to work and be made to feel his political opinions may prejudice his earning a livelihood. Any outcry raised against a clause which recognises that the Trade Unions may exert political powers, but which makes contributions to a fund to support political objects voluntary, can only serve to demonstrate that political coercion has hitherto been exercised. The change is only that a political levy shall not be made as a matter of course compelling members to take steps to contract out if they so desire, but that members compelled to join a union, if they desire to forward its political objects, shall express their willingness to do so placing them in in the same position as any member of a free electorate. The Labour Party stand for their slogan "the right to work," but coupled with this has been the further condition "if support is given to the political objects of the Labour Party." The Bill stands for the right to vote and will prevent men who poll on one side at an election having had to contribute to the funds of an opposite party for fear of being prejudiced in the work necessary to enable them to live.

There are other provisions in the Bill relating to Civil Servants and to local authorities: Clause (6), for instance, makes it unlawful for any local or other public authority to make it a condition of the employment or continuance in employment of any person that he shall or shall not be a member of a trade union, and a new clause is to be added to section 5 of the Conspiracy and Law of Property Act, 1875, as follows: "If any person employed by a local or other public authority wilfully breaks a contract of service with that authority, knowing or having reasonable cause to believe that the probable consequences of his doing so, either alone or in combination with others, will be to hinder or prevent the discharge of the functions of the authority, he shall be liable on summary conviction to a fine not exceeding £10 or to imprisonment for a term not exceeding three months." This is only an application of the existing section to functions exerted by local and public bodies; the section already applies to breaches of contracts of service which may endanger human life or cause bodily injury or which may expose valuable property to destruction or serious injury.

Our space does not permit us to set out all the provisions in the Bill or to discuss them in detail, and we must close by simply referring to the definition of what is a "strike" contained in clause 8, subclause (2). "'Strike' means the cessation of work by a body of persons employed acting in combination, or a concerted refusal under a common understanding of any number of persons who are or have been employed to continue work or to accept employment." This definition is sure to excite discussion, and incidentally it will raise the question of "lock-outs." Throughout the Bill there is no mention of the lock-out, and the reason for this may be that it is difficult to see how a lock-out could effect the results this Bill is intended to provide against. Could that be shown, we imagine there would be no hesitation in applying like provisions to employers. It is to be noted that clause 3, which is directed to preventing intimidation, includes the employer as it is.

There must be a feeling of regret at a time when industrial peace is anxiously being sought that a Bill such as this should have to be introduced, and the inclination of most persons would be to let matters slide and hope for the best. But, as against this view, the facts of last year have to be borne in mind; the trade unions have become political organisations which in the first place can to a great extent coerce their members to provide funds for political purposes, and they use those funds to challenge the authority of Parliament and to coerce the nation. Can a house be set in order that is divided against itself?

The combination of industrial and political functions has led to this result, and many trade unionists themselves are now alive to the disadvantages of the system. The alternative to this Bill would be to divorce politics altogether from trade unionism and to allow the unions to revert to their original functions of purely industrial societies. That could be accomplished by a one-clause Bill; but such a Bill would excite no less controversy amongst the political leaders, but rather more antagonism, as it would deprive the unions of any political functions at all, which the present Bill is careful to avoid. We ourselves feel strongly that a blend between politics and industrial questions is an impossibility if trade is ever to prosper, and we have always regretted that in 1913 political questions were imported. We wish to see the unions strong in their industrial functions and wish them well, and we have always hoped that reform would come from within the bodies and that matters would themselves come right. But the conflagration of last year has brought these questions to a head, and ill-directed leadership and not the Government is responsible for this Bill.

Brickmakers' Wages.

Brickmakers, it is reported, are agitating for an advance of wages. The joint committee of employers and operatives has considered the application but without agreement. The executives of the unions will now review the position with a view to concerted action. The unions contend (says the *Times*) that wages in the industry are low and that the industry is able to pay more. Their claim is for increases of 4s. per week for adult male time-workers, 3s. for males between 18 and 21 years of age, 2s. for youths under 18; 3s. for females over 18, and 2s. for girls under 18; pieceworkers to receive proportionate increases

THE PRESERVATION OF STONEWORK

Mr. H. Jarman, of His Majesty's Office of Works, gave a short survey of this subject, in a lecture on "Craftsmen and their Materials," read to workers in the building trade, at the R.I.B.A., on March 22, a part of which we gave last week. The lecturer said that the greatest aim of all sincere craftsmen was to leave behind in their respective spheres, whether it was art or craft, something that would withstand the ravages of time, and the erosion of their handicraft by the relentless forces of nature, either acting upon it gradually and defacing the work, or internally eating it away by decay, either through physical changes in its structure, or biological, or other influences. Man had down through the ages spent a lot of thought and time upon his work to stop these forces of decay without being able to entirely arrest them. In a lecture delivered by Professor Laurie to the Society of Chemical Industry, on December 11, 1917, on preservation of decaying stone, the professor mentioned, said the lecturer, that many substances had been put on the market with a view to preservation, which in practice had produced a temporary effect, but ultimately resulted in scaling. All preservatives of a greasy nature, such as oils or wax, resulted in ultimate scaling. Many salts in solution were experimented with on a very porous stone, but in nearly all cases rapidly came to the surface, although the stones had been saturated. A few exceptions were found. Organic tests were carried out in the same way, there being a distinct tendency for the salts to crystallize just under the outer layer; experiments were continued with sand with the organic solutions as a binding material; in all cases the result was the same—surface hardening with little or no effect internally, gelatine being the only solution acting throughout. The conclusion was that no re-agent was found to prevent deposition on the outer surfaces, but the addition of a little glycerine to water solutions was sufficient to prevent it. Professor Laurie went on to state that the direction inquiry should take, should, if possible, be to find an inorganic substance insoluble in rainwater, yet capable of forming a successful cement for stone particles. Many further experiments were carried out to find a precipitate which could be successfully made to penetrate and remain in the stone internally. Professor Laurie wound up by saying the experiments had not successfully solved the problem, but they had found out a little of the complex nature of the subject and possible directions in which a solution might be found.

Everywhere around us, said the lecturer, we observed man constantly "building up" from various materials and all the time nature was taking toll of his labour, and slowly but inevitably breaking down the result of his work. That should be a spur to man's endeavour, causing him to evolve new ideas in his search for all that was lasting and best, and endeavour in his daily comings and goings to find the means of arresting the decay of building material. The most outstanding feature was that of the weathering of stone. There were many streets in London in which one might notice beautiful examples of architecture disfigured from that cause alone, evident to the most casual observer. In considering the primary factor responsible for the breaking up of building stone, it had become almost a truism to state that the sulphur gases given off from the burning of coal were the cause. That, up to a point, was undoubtedly true, but it did not help us much, the problem had to be probed much deeper if an accurate conclusion was to be arrived at, a conclusion which would be of practical value in the evolution of some means of preventing decay. There was not the slightest doubt but that decomposition occurred under one of two conditions:—

(1) The formation of calcium sulphite due to sulphurous acid gas in the atmosphere acting on the calcium carbonate of the stone. Owing to further action of the acid on the sulphite, the latter was converted into a soluble calcium disulphite which, owing to capillary action, was drawn further into the stone. The further action of atmospheric oxygen oxidised the salt to calcium sulphate, which, upon crystallisation, broke, or tended to break, the structure of the stone.

(2) The natural weathering of the stone due to atmospheric erosion, and the formation of the soluble calcium bi-carbonate, which bleached out and so destroyed the structure of the stone.

It would be observed, said the lecturer, that the formation of calcium sulphate, which, of course, was another name for gypsum or plaster of Paris, was not a simple proceeding; moreover, the process of conversion and the final breaking up of the stone would be spread over a period of years.

The acid attacking the stone was but one aspect of the problem; it could often be observed that although the surface of the stone was flaking off, yet the stone itself was perfect in so far as the bond and structure was concerned. How then did the points he enunciated affect this problem?

When such a happening just mentioned occurred, in the majority of cases it would be observed that the breaking up was at the sides of the stone, close to the joint. In such a case, it was invariably noticed that the pointing had gone, or was decaying. The solution here was simple. The sulphurous acids had attacked the lime in the cement or mortar and the soluble calcium (lime) salts had been drawn into the stone, there to become oxidised to sulphate of calcium, upon crystallisation of the latter. The stone was unable to bear the strain and cracks across the face, a frost came whilst the stone was wet, and upon the water freezing and therefore expanding, the fragment of stone burst from the block, much the same as a water pipe burst in the winter.

It might often be observed that some stones on a building for no apparent reason, decomposed much more rapidly than others. When this was the case, and a piece of the stone was examined, at the back of the fracture a deposit of soot might be found. Now it was a well-known chemical fact that finely divided carbon had a high catalytic action on the formation of salts from acid gases, and it seemed beyond dispute that the carbon particles speeded up the formation of the calcium salts. In fact, wherever those particles found lodgment in the pores of a stone, under damp conditions, decomposition must inevitably occur.

Stone preservation was a much abused term, and the question immediately arose, could there be any efficient method whereby building stone could be preserved from the ravages of the atmosphere? The lecturer thought it was possible to prevent decay by one or other of the following means, but he added the proviso that they were simply temporary measures:—

(1) One or more coats of paint or like covering materials.

(2) Pore fillers, such as metallic salts that acted by double decomposition without chemically combining with the components of the stone.

In addition to those temporary measures, there was a method whereby chemical substances combined with the stone, forming hard insoluble compounds. That was a more permanent measure, but the problem in this case was to ensure a deep penetration into the body of the stone.

Perhaps the most widely known of those more permanent measures was the method of treatment by magnesium silico-fluoride. Many users claimed success in the use of that process, whilst many others did not meet with success.

It would doubtless interest many to hear some details of a process which had been tried out for some considerable time; it was a great advance on the above-mentioned, and the problem had been tackled on entirely new lines.

Use was made of the gaseous silicon compounds. The discoverers of this unique method of treatment offered the assurance that it was possible to harden a stone to as great a depth as the gas could penetrate the stone. In such a case, a block of stone was placed in a vacuum, freeing the pores or tubes in the stone of air, and the gas was then passed into the chamb and in a few minutes the operation of hardeni was complete, but, of course, this method co not be applied *in situ* on a building. In th latter case use was also made of the gaseo compounds and necessitated two treatments the stone. The object was:—

(1) To affect a slow hardening of the sto to a depth beneath the surface.

(2) To harden a skin surface quickly and protect the process of the slow hardeni beneath. The effect of that treatment w that the stone had a hard acid and weath resisting face which fully protected the sl hardening process from all atmospheric co ditions. Ultimately, when the hardening p cess was complete, all the stone particles wo be bonded together into a hard, acid a weather resisting unit. A striking feature the process was the ease by which hard, weath resisting compounds could be synthesised the body of the stone, not only in the pores b chemically combined with the components the stone. It should be noted that where t pores of the stone were merely filled wi compounds effected by double decompositi of metallic salts, for a time after the treatme the stone was somewhat resistent to percolatio but when the stone dried out, the introduc salts became dehydrated and shrunk and t stone was practically in the same state as bef treatment. The advantage, therefore, chemical activity in the treatment appear to be essential if the result was to have a permanent value.

The lecturer's own theory was, that as natu had provided the cementing material for rocks, that all stones needed a supply of th material—whether it be carbonate of lime solution or silica in a like manner—which, as proceeded to the outer atmosphere, would ta with it enough of the stone contents and oxid on the surface and thus case-harden the ston In other words, the drying and oxidising on t surface of the quarry sap.

His conclusion was simply explained. It w that outside application of any kind resulted hardening a thin outer surface which, when became cracked or crazed, let in very little first, but ever-increasing quantities of atm spheric pollution. The time came sooner later when the effects were bound to show scaling, so we should therefore get our chemi to work to solve the problem of nature's cemen ing material, and then to apply that solution bulk internally and allow it to percolate its w to the face, cementing together the particles oxidisation on the exposed surfaces and bindi together the substances more perfectly throu out its mass.

Flats in Old Mansion.

The National Trust proposes to form a co pany to acquire Swakeleys, near Uxbridge, c of the finest examples of Charles II architect in Middlesex, at a cost of £7,500, and convert into flats. It is thought that if Swakeleys c be saved in the manner suggested it will set example which will preserve many similar hou in other parts of the country.

Lead Paint.

The Home Secretary desires again to draw t attention of all master painters, master build and others employing persons in painti buildings, to the provision in the Lead Pa (Protection against Poisoning) Act, 1926, wh came into force on January 1 last, requir every person who employs other persons painting buildings—*whether he uses lead paint his work or not*—to send to the Factory Inspec for the district in which his office is situated written notice stating his name and the addr of his office. This requirement was mentio in announcements widely published in the Pr in December last; but so far a comparativ small proportion of the employers appear to h registered. Failure to register is punishable summary conviction by a fine not exceed three pounds. If the employer does not kn and cannot readily obtain the Inspector's na and address, the notice may be sent under co to H.M. Chief Inspector of Factories, Ho Office, London, S.W.1.

(For rates of wages in the Building Trade in Scotland, see page 627.)

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

Following is a list of abbreviations:— Borough Surveyor, B.S.; Borough Engineer, B.E.; District Surveyor D.S.; Clerk, C.; Town Clerk, T.C.; County Engineer, C.E.; County Surveyor. C.S.; County Architect, C.A. Surveyor, S; Engineer, E; Borough Architect, B.A.; Architect, A.

THE INCORPORATED CLERKS OF WORKS ASSOCIATION

The forty-fourth annual dinner of this Association was held at the King's Hall, Holborn Restaurant, on Saturday, April 9th, Mr. Maurice E. Webb presiding over a gathering of about 450. Amongst those present were: Mr. Louis Ambler, Lt.-Col. Preston, Dr. C. Drysdale, Mr. C. A. Voysey, Mr. Walter Cave, Mr. W. Woodward, Mr. T. P. Bennett, Major A. D. S. Rice, Mr. A. H. Adamson (President, L.M.B.A.), Prof. C. H. Reilly, Mr. H. J. Leaning, Mr. H. Westbury Preston (Master, Worshipful Company of Carpenters), Alderman Wm. Peet. Mr. A. J. White (President, I.C.W.A.), Mr. W. L. Tett (V.P., I.C.W.A.), and Mr. W. H. Page (P.P., I.C.W.A.)

After the customary loyal toasts had been honoured, Mr. P. J. Luxton, proposing the toast of "The Architects," said the relationship which existed between the architects and the members of the Association was of a most friendly character. The architects came to the Association when they desired the services of a competent clerk of works, and the members of the Association when they desired employment went to the architects. The general public looked upon an architect as a very superior sort of person, but they knew nothing much about the clerk of the works, who was responsible for seeing that the conceptions of the architect were carried out.

Prof. C. H. Reilly, responding, said in the hands of the architects, however qualified or unqualified they might be, the external aspects of civilisation rested. There was no doubt that the whole appearance of our towns and a large section of the country-side depended upon the architects for good or bad. He thought at the present time we were making finer buildings than during the past hundred years. They would all have noticed, he continued, that the R.I.B.A. had a Bill before Parliament for the Registration of Architects. The object of that Bill was to ensure that the profession should consist of people who were fully qualified to rank as architects. A great scheme of education had been instituted by which in a few years time it should be possible for those possessed of artistic ability to go through one of the big schools by means of scholarships and qualify for membership of the architectural profession. The scheme should be open to all artists because they were possessed of imagination, and it was people of this type that they needed most in the profession.

The Chairman, proposing the toast of the "Incorporated Clerks of Works Association," said it was always a pleasure for a member of his profession to preside over such a gathering. For himself, perhaps, it was a double pleasure, because his father, whom many of them knew and some had worked with, had occupied the same position twenty or thirty years ago. He thought that the profession of clerks of works was one of the oldest in the world. He had found that the first mention of a clerk of works in the English language was in the year 1246, when one was appointed to Windsor Castle. A little later when Carnarvon Castle was being built a clerk of works was appointed at 8d. a day, the Master of Works receiving the magnificent sum of 2s. per day. Then, a little later on, a very famous man became clerk of works, namely, William of Wykeham, who had very direct instructions given to him that he was to employ all carpenters, joiners and painters, in addition to which he had to order all stone and other materials required for the works. At the end of the 14th century a still more famous man became a clerk of the works to the Royal Palaces. This was Chaucer the poet, and for his services he received the salary of 2s. per day or rather less than £31 per annum. He thought if the clerk of works pinned his faith on the building being well done, half his troubles would be surmounted. He believed the men themselves wanted to do good work. In conclusion he wished the Association long life and prosperity.

Mr. A. J. White (President, I.C.W.A.), responding, said it was very gratifying to the members to have Mr. Webb in chair that night, as the chairman's father, Aston Webb, occupied the chair thirty-five y ago and again ten years later, which sho that the Association had been able to re the respect and regard of one eminent firm architects for many years. Their Associati he continued, was not connected with political or other body, their functions bein a social and benevolent character. They deavoured to help their infirm members thro the Benevolent Fund. At their monthly m ings at Carpenter's Hall they usually secu an expert in some special branch of the build industry to lecture to them, and they had some very excellent and instructive lect during the past twelve months.

The toast of "The Surveyors" was propo by Mr. W. L. Tett (Vice-President, I.C.W.A. which Mr. H. J. Leaning, F.S.I., replied.

The toast of "The Worshipful Company Carpenters" was proposed by Mr. H. W. P and Mr. H. Westbury Preston (Master, Wors ful Company of Carpenters) responded.

The toast of "The Builders" proposed Mr. J. G. Russell was responded to by Mr. A. Adamson, F.I.O.B.

The concluding toast of "The Chairma was proposed by Mr. Wm. Lake, and Chairman replied.

PRESENTATION DINNE

A large gathering of the indoor and door staff of Messrs. Holliday & Greenwo Ltd., assembled at Anderton's Hotel, Fl street, E.C., on Thursday evening, March the occasion being a presentation dinner Mr. G. H. Prior on his retirement from firm after 43 years' service. Mr. D. Devlin, the secretary of the firm, who t the chair, said that it was a great pleas to him to have the honour of asking Prior to accept, as a token of their est and regard, a gold watch which had subscribed by the whole of the staff. He known Mr. Prior a great number of ye and during that time he had not only fo him a true colleague in business, but als very staunch friend, one who was alw ready and willing to assist others. They hoped Mr. Prior would have good health long life to enjoy the rest he so ri deserved.

Mr. J. Farndon, on behalf of the out staff, seconded.

Mr. Prior, in reply, said he joined the s of Messrs. Holliday & Greenwood, Ltd. the early days of the firm, and during time he had seen many changes both in personnel of the staff and the conditions the trade. He thanked the whole of staff for the handsome watch they had sented to him, and assured them that would always carry it, and it would re him of the many happy days he had s with them.

Mr. Tyrrell proposed a vote of thank the chairman, coupling with the toast " Continued Prosperity of the Firm."

A vote of thanks to Mr. J. Farndon, was responsible for the whole of the arra ments, including an excellent musical gramme, brought the proceedings to a c

National Federation of Housebuilders.

With reference to the report of the an conference of this Federation, given in our i for April 1, Mr. H. R. Selley, in drawing atte to the fact that he is reported as saying tha "saw no reason why 20 or even 32 houses c not be built to the acre," writes as follow "I do consider that 20 houses to the acre aff ample light and air, and in passing I drew at tion to the L.C.C. Estate at Totterdown Fi Tooting, on which 32 houses had been bui the acre. This was a pre-war estate and a roads are wide it does not present a cran appearance. My reference to it must no taken as advocating 32 houses to the acre.

TRADE NEWS

Travelling Exhibit of Radiators.

e National Radiator Company, Ltd., of , advise that their travelling exhibit of their al" radiators and boilers has just left Hull tour which will extend until the middle of ber. Whitby will be visited on April 20 21 and later on the principal towns in am, and Newcastle, will follow, then the Riding of Yorkshire, the Lincolnshire ty Agricultural Show, the Midlands, Royal shire Agricultural Show, and the principal s and cities in Lancashire including Man- er and Liverpool, also the North Wales .

The May Fair Hotel.

th reference to this hotel, which we illus- d and described in our issue for April 1, we stand that the sub-contract carried out by ockwood Flooring Co., Ltd., of 57, Palatine ings, Manchester, was not for general g, but for the covering of the main stair- and landings in terrazzo of reconstructed on-Wood, and in addition the lining-out of ndings and their panelling with Belgian marble.

are also given to understand that the lt used in the construction of the hotel upplied by Messrs. Thomas Faldo & Co., of Windsor House, Kingsway, W.C.2.

The Victoria Baths, Southport.

espect to these baths, illustrated in last s issue, we are informed that the complete ering installation used, including appara- r pumping the sea-water, hot and cold es, laundry machinery, heating and the -heated Turkish bath, was the work of s. W. Matthews & Son, Ltd., heating ers, of York-street, Manchester.

Speaker's House, Belfast.

are given to understand that the entire r roof work of the Speaker's House, ated in our last week's issue, and the ete plumbing installation with the excep- f the sanitary fittings, was the work of s. John Dowling & Son, Ltd., of Upper -street, Belfast.

THE SCOTTISH BUILDER

EDINBURGH CENOTAPH SITE

The Lord Provost's Committee of Edinburgh Town Council has approved a report from the sub-committee recommending the Town Council to agree that the proposed war memorial be erected in one of the arches in front of the City Chambers in the High-street. The Edinburgh Area Committee of the British Legion submitted a resolution in favour of the site to the west of St. Giles' Cathedral, and stating that if the lack of money was the only drawback to the removal of the Buccleuch Statue, they were prepared to find the necessary funds. The resolution further stated that the memorial should not be called a cenotaph, but a cross of St. Martin, similar to that outside the door of Iona Cathedral.

NEW BUILDINGS IN SCOTLAND

Gartly.—HALL.—Funds are being raised for the proposed new hall at Gartly.

Edinburgh.—BUILDINGS.—The Dean of Guild Court has passed the following plans:—The Scottish Motor Traction Co., Ltd., garage, New-street, on Bathgate Park; Corporation electricity sub-stations at Inglis Green-road, Slateford, and at Fairmilehead; Edinburgh and Suburban Building Society, Ltd., 17 bungalows off Craiglockhart-road; and Mr. J. Kyles, nine houses and 15 garages at Roseburn-crescent and Roseburn-avenue.

Fraserburgh.—HOUSES.—The Town Council has accepted a recommendation of the Housing Committee for the erection of four new blocks, containing four three-apartment houses each.

Edinburgh.—HOUSING.—The Housing Committee of the Town Council has decided to recommend the Town Council to purchase Cameron House and park, at the foot of Dalkeith-road, for an extension to the present housing scheme at Prestonfield.

Aberdeen.—RECONSTRUCTION.—The Electric Theatre, 431, Union-street, is to be rebuilt. The new hall will seat over 2,000, and it is estimated that the reconstruction and re-equipment will cost from £60,000 to £70,000. The Aberdeen Picture Palaces, Ltd., 3, King-street, are the owners.

Greenock.—CINEMA.—A site in Brougham-street has been purchased by the Greenock Picture Palace Co., and plans for the new cinema are to be prepared.

Huntley.—HOUSES.—The Town Council has decided to erect four blocks of houses.

Labert.—BUILDINGS.—An appeal for £70,000 to complete and equip buildings for the accommodation of 300 adult mental patients is to be made shortly by the directors of the Royal Scottish National Institution for Mental Defectives.

Troon.—HALL.—The Dean of Guild Court has passed plans for a new hall at St. Ninian's Episcopal Church, Bentinck-drive, at a cost of £3,200. The building will comprise a main hall to accommodate 300 people.

The Boulevard Haussmann.

The new section of the Boulevard Haussmann was opened recently. The execution of Haussmann's plan has lasted more than three-quarters of a century, and has twice been interrupted by wars. The space where the Boulevard Haussmann meets the Grands Boulevards is not yet very presentable, says *The Times*, for the new building which forms the point of the "V" is still masked by scaffolding, and the corresponding site on the other side of the road is still a gaping void, backed by a cliff of brick wall, which has been given up to advertisements. The finishing of the Boulevard has been made to coincide with the opening of an important new section of the Underground Railway. It is also understood that the Committee which is dealing with traffic problems has come to an important conclusion. It has been considering the practicability of underground passages for wheeled traffic, with a view to relieving the congestion of the streets. This solution has been found impossible, and the only hope of improvement which the Committee holds forth now lies in the gradual broadening of a certain number of impo streets. The proposals for underground ga have also met with an unfavourable rece from the experts, owing to the unsuitable n of the Paris sub-soil.

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

CXXXII.—No. 4394. APRIL 22, 1927.

ONE GOOD THING AT LEAST

DURING a lull in the controversy upon the question of Registration, we may with profit occupy ourselves with a little mental stocktaking. Registration may or may not come, and it may come in one form or another, and we feel that, for the time being, at any we have given voice to sufficient opinion upon the matter. clear, however, that the vast and earnest efforts which have made to bring this matter to a head will have brought t at least one good thing, whatever turn politics may next We are convinced that these efforts have engendered v sense of corporate unity within the architectural profession. or perhaps the first time within the memory of man, by an st overwhelming majority, members of the profession have d to express themselves in favour of a definite line of policy, of a definite course of action. It is not our immediate ose either to applaud or criticise this definite line of policy is definite course of action, but we are convinced that the icance of the fact has yet to be fully appreciated, both within and from without the profession. We regard it lves as a distinct sign of a new corporate strength among tects, the potentialities of which must be almost without ; and if we could apply it to the solution of the many ems which face us now, and which will face us in the future, is no doubt that there would be a wonderful clearing of the sphere.

e do not suggest that members of the profession should act into or out of a rigid political creed, but we do urge there are many matters which should be approached in a rate spirit, and that the official voice of the profession d be permitted to speak with a greater weight than the ssions of mixed individual opinion. It does appear to us nes that architects, with the best intentions in the world, with the most sincere sense of conviction, are very prone to into print and throw the lay conscience into confusion e a general mature judgment has been passed by a fairly imous majority of their fellows. To the man in the street, often the first impression that remains the last, and a well-ructed letter from one qualified individual may outweigh mind any belated expression of considered opinion coming the Institute as a whole. The opinion of the individual at times be the right one, and the official voice may be g, but we believe that by the laws of average, in ninety out of a hundred it will be the individual who will be g, and we feel that, in any case, it is but seemly that official voice should be allowed to make the first ssion.

e may quote an instance where this principle might have applied with advantage. The question of the Thames es has been before us for many years, though particularly n the last two or three. Would it not have been far better hitects had thrashed this matter out among themselves, n a domestic atmosphere, before individuals from their had voiced their opinions in the public Press? We believe, natter of fact, that there is a very near approach to unanimity e profession upon this important subject, but is it possible e man in the street to realise it? Does he not bear in his rather a confused medley of technical and artistic advice, ich one calls for a bridge here, another for a bridge there, r this bridge to be retained at all costs, and another for the bridge to be swept away? Is not an already difficult question still further confused by this state of affairs, and would it not be so much more simple for the layman to form a right judgment if he were able to say that "the architects" thought this way? We ask for no muzzling of individual opinion; we simply plead for a fair field for the official voice of architecture, which has already proved that it is articulate, by the fact of the Registration Bill. We shall not be dismayed by an appearance of discord, for frank discussion upon any subject, however involved and difficult, is bound to uncover a vein of kinship in ideas, along which, with charitable intent to think broadly, all the essentials of unanimity may be found. It may be a matter of pure conjecture as to whether our post-war housing problems might have found an easier solution behind a united lead from the profession, but it can hardly be doubted that such might have been the case.

Yet another matter, which would seem to be with us always—our inveterate civic untidyness. We do not refer to the scavenger—with whom we have no quarrel—but to that general "sloppiness" in civic detail, to which we never cease to call attention, and against which we shall never tire of protesting. We have had, and we welcome, the warm support of countless individuals in the architectural profession in our campaign, but we must confess that we are not entirely conscious of the support of the whole body of architects, and we are inclined to doubt if this matter is being taken sufficiently seriously.

Whole areas of London are being demolished, to remain in desolation for months at a time, and sometimes for years, with no effort to make the interim at all sightworthy. The romantic groups of scaffolding and derricks which mark some new building effort are defiled by the irreverent bill-poster, and long ungainly arms stretch over the village pavement from petrol pump to curb at every few yards. These are but a few of the signs of an untidyness which is as much mental as physical. How very much nearer we should be to civic order if every architect felt that his profession called upon him to make his protest against these things, and if every public body was aware that an entire learned profession rebuked them when they ignored the decencies.

We appeal to the whole body of architects to make use of this waiting period, during which the fate and form of the Registration Bill hangs in the balance, to consider the many ways in which a united profession can act for its own good and for that of the country at large. It is a big matter to consider in every way, but all the more worthy of serious thought.

We are convinced that there is much good work to be done if our problems are approached in some such broad spirit as we have sketched, and we believe that there are many, even among those who are bitterly opposed to the Registration Bill in its present form, or, for that matter, to any Registration Bill at all, who will feel thankful for such corporate effort, if the lesson learnt from it can be applied towards the solving of other and greater problems with which we are bound to be faced in the future. Let architects forget their little bickerings; let them do their utmost to assist in concerted thought and action, and let them remain loyal to the same. Thus may we find their great profession about to take its rightful place of importance in the centre of civic life.

Without fear of raising a point of contention at an unsuitable time, we point to these considerations as together forming at least one desirable outcome of the Registration campaign.

NOTES

Sound Criticism.

Whatever may be thought about the criticism of modern building, we can surely feel that there is a kind of criticism which is of real value. We have heard it argued that the safest and best way is to be satisfied with appreciation of what is good and omit comment on what is indifferent or bad. We can hardly subscribe to this, but it is certainly very pleasant to read such an appreciative notice of modern architecture as that which appeared in the *Times* on Tuesday, *apropos* of the opening by the King of part of the Museum at Cardiff. This article is not only discriminating but generous, and architects should be glad that our leading daily paper has enabled the public to realise something of the better qualities of modern work through the agency of a competent critic. The fine qualities of Messrs. Lanchester & Rickards' buildings are duly noted with a probably fair reservation, the wholly admirable result in Messrs. Wills & Anderson's small University Registry building, and full recognition of what Messrs. Vincent Harris, Percy Thomas, and T. G. Moodie have also done, lead up to very generous notes on the partially completed national Welsh Museum, by Messrs. Smith & Brewer, now being carried out by Mr. A. Dunbar Smith with such good feeling as to scale, proportion, and dignity.

A Fortunate City.

Cardiff is assuredly to be congratulated on its good fortune in the splendid gift of land from the Marquis of Bute, the wise and far-seeing action of its City Council, and the high standard of architecture which the city has been fortunate enough to secure. We could hardly point to any other town or city which has been blessed by such a combination of good fortune. It is only to be hoped that other town and city authorities will emulate so noteworthy an example.

Progress Scheduling.

The hope is often expressed that before long there will be introduced into all our technical schools, where building is studied, a special course of training in progress scheduling, such as is practised in the United States, Canada, and elsewhere. Mr. Hugh Davies, the well-known inspector at the Board of Education, who is mainly responsible for the details of building education, has, we understand, been taking considerable personal interest in this question. Scheduling depends in the first place in studying exactly how much time it will take to do work of various kinds on any building. Such subjects have to be carefully considered—as how long material has to be on the job before it is required; when the stonework and steelwork shall be sorted and stacked; when the approved shop drawings should be provided to contractor by the architect; at what date the various stages of the building should be completed. It is estimated by those who have been studying the subject, that in spite of the special difficulties in this country resulting from out-of-date building by-laws and the laws of Ancient Lights, that scheduling would reduce the ultimate costs of building from 5 per cent. to 10 per cent., without in any way affecting labour charges or profits. Probably at technical schools the problem of progress scheduling will be part of a course of advanced lectures in quanti surveying, and it is hoped that the Offi of Works, the London County Counc and other public bodies will provide fr their records definite data on which base these lectures.

Stone Sculpture Group for the County Fire Office, Piccadilly Circus.

Sir Edwin Cooper, Architect.

Society of Master Glass Painters.

There is much of inter for the reader in the Ap number of the Journal this Society, which inclu a variety of themes deal with subjects of importance to all c versant with the art of stained gl Mr. J. A. Knowles, who has a happy w of contributing much good humour a accuracy of information in his a quarian studies, gossips pleasantly on gl painters' advertisements, and refers passing to a handbill issued by J Constable, R.A., giving the prices for landscapes. Henry Gyles, of Y (1645-1709), appears to have been the f glass painter to issue an advertisem William Peckitt (1752) informs us that executes "Scripture pieces for chu windows, arms in heraldry, &c., in neatest and liveliest manner." All t it is agreeable to learn, and diverts from the superstitions that invest a thing ancient in glass with superhu virtues to the detriment of work in g executed at the present day. T Society aims to protect the interests both the individual worker and the c as a whole, and its Journal includes m useful information—antiquarian, scien and artistic—on this attractive them

A Visit to "The Star and Garter" Home, Richmond.

Last Saturday week this War Memorial Home disabled soldiers, erec on the splendid site o looking the Thames on summit of Richmond Hill, was vis by a representative and apprecia company organised by the Art Commi of the R.I.B.A. The hon. archit

Edwin Cooper, conducted the rs over the buildings, and explained of the structural details, including the beautiful memorial chapel hed to the home, with a separate nce for its grounds. The mortuary l close by is extremely well situated, ully equipped and decorated. From point of view, the grouping of the ngs is most satisfactorily managed, ner seen from the Park or from looking up from the river. Before g, at conclusion of the tea provided e authorities, a vote of thanks was sed to Sir Edwin Cooper for his esy in attending to meet the party explain the building. Mr. Maurice lams, at the request of the company, took this motion and signed the rs' book on their behalf as a record of the occasion. Sir Edwin Cooper, in responding, paid a warm tribute to the Governors and builders and to the able services of his clerk of the works.

Sunlight.

The importance of sunlight, and more especially of the admission of ultra-violet rays through our windows and smoke fogs, is daily being insisted upon. The trouble at present is that the cost of glass that permits the passage of these rays is inordinately high and beyond the reach of the ordinary man, who has to pay more for his house already than he can afford. We hope that no effort will be spared in the attempt to reduce the cost of such glass as, under present conditions it is impossible to look for its general use in home, school, and factory. There appears to be little doubt that, with the elimination of smoke, fog, and the common glass that intercepts ultra-violet light, we should enormously improve the public health and resistance to disease.

(*See page* 640.)

Wood Statuette—Breton Mother.

The late F. Derwent Wood, R.A., Sculptor,

Notes on Exhibitions: The French Gallery.

The French Gallery in Pall Mall is interesting as usual. One sometimes wonders how it is that we find so much coldness in the greens of French landscape art. It is often a coldness that is somehow rather raw; not the coldness in the charming little landscape by Sir C. J. Holmes of mountains under snow (56), which is a charming bit of colour. In the "Fontainebleau" (1), by Corot, we find the usual grey-green (a delightful little picture), but in such pictures as Nos. 2 and 11, vivid as they are, the coldness of the colour has a something of rawness in it, and is a great contrast to the rich effect of Corot's "Cours d'eau au Rives Boisées" (4). This is a masterpiece of its kind, with a breadth of soft, rich green foliage in contrast with a pearly blue sky. The "Pastorale," by Jacque (6), has a wonderfully vivid effect of light, and probably with rather less insistence of detail in the foreground would have been finer still. Sir J. Lavery's "Sidi-bu-Said" (38) is a delightful passage in grey, and Fantin Latour's, "Les Pêches" (53) is a most delightful study of fruit. One of the really poetic things in the Exhibition is the "Evening," by M. de Bock. It seems hardly credible that Corot should have painted the flower piece (20); it is certainly lacking in colour value.

GENERAL NEWS

Professional Announcements.

The Chelsea Borough Council have appointed Mr. Archibald S. Soutar, L.R.I.B.A., of 8, King William-street, Strand, as architect in connection with the Council's proposed scheme for the improvement of the World's End Passage Area.

We are informed that Mr. Arthur Edwards has been joined in partnership by his son, and that they will practise in future as Messrs. Arthur Edwards & Son, at a new address, King's Court, 115, Colmore-row, Birmingham. Telephone No.: Central 943.

Mr. Ernest Fiander Etchells' Estate.

Mr. William Edward Ernest Fiander Etchells, of Franciscan-road, Tooting, S.W., Hon. A.R.I.B.A., A.M.Inst.C.E., A.M.I.Mech.E. (net personalty £977), left £1,476.

Sir Luke Fildes' Estate.

Sir Samuel Luke Fildes, R.A., of Melbury-road, Kensington, who died in February, aged 83 years, left estate of the value of £69,029, with net personalty £68,572.

Stadium at Blackpool.

The Blackpool Corporation has granted to Mr. C. B. Cochran a site of 700 ft. square on which to erect a stadium capable of accommodating 100,000 people on the new promenade at South Shore.

Swedish Sculpture.

Owing to the interest aroused by the exhibition of works by the Swedish sculptor, Carl Milles, at the National Gallery, Millbank, it has been decided that the exhibition shall remain open until 6 p.m. on Sunday, May 1.

Accident to Architect.

While making an inspection on a scaffold at the top of a new building in Piccadilly on Wednesday Mr. E. Crutchley, a young architect on the staff of Messrs. Wimperis, Simpson & Guthrie, fell 40 ft. to the pavement and broke both his legs and injured his ribs.

Structural Engineers' Annual Dinner.

The annual dinner of the Institution of Structural Engineers will take place at the Piccadilly Hotel on May 16, with the Right Hon. Lord Carson, P.C., K.C., as principal guest. It is expected that over five hundred members will attend.

The Royal Gold Medal for Architecture.

Intimation has just been received that His Majesty the King has approved the award of the Royal Gold Medal to Sir Herbert Baker, A.R.A., F.R.I.B.A., in recognition of the merit of his work as an architect. The Medal will be presented to Sir Herbert Baker at the banquet of the R.I.B.A. on June 23.

L.C.C. and Prince's-square, Kennington.

The L.C.C. have granted £500 towards the buying of Prince's-square, Kennington Park-road, S.E.—one of the few open spaces in the district. Recently it has been threatened with destruction. The owners of the square, it is understood, have just reduced the price to £2,000, and with the £500 offered by the L.C.C., it is hoped that it may be possible to preserve the square as a playground.

Birmingham Extensions.

The Birmingham City Council has sanctioned the erection of a new central fire station on an island site at the junction of New Corporation-street and Aston-street, the cost of which, inclusive of demolishing the present buildings on the site, re-housing tenants and providing fresh offices for the Corporation Weights and Measures Department, will not exceed £200,000.

Free State War Memorial Dispute.

In the Irish Free State Senate leave was given on the application of Senator Jameson to withdraw the Merrion-square (Dublin) Bill, 1927. The promoters of the measure, he said, had accepted the inevitable, and had taken counsel as to what steps would now have to be adopted to satisfy their legal liabilities to their subscribers. The Bill, which provided for the erection of a national war memorial in Merrion-square, was rejected by the Dail at the instanec of the Free State Government.

Architectural Association Arrangements.

An Exhibition of Modern Danish Architecture is being arranged by the Association to be held in the hall of the Art Workers' Guild, Queen-square, Bloomsbury. The exhibition will be opened on May 23 by His Excellency, Count Ahlefeldt-Laurvig (Danish Minister in London), and will remain open to the public for two weeks.

The Excursion for 1927 will be held during the second two weeks in September, and arrangements are being made to visit Salzburg, Vienna, and Prague. Full details will be given later, but it would be of material assistance if members wishing to join the excursion would enter their names provisionally as scon as possible.

Obituary.

Mr. Hugh Gavin, a well-known Forfarshire architect, has died at Arbroath, 68 years of age. Coming from Malta, where his father was an instructor in navigation, Mr. Gavin was educated at Stirling, and qualifying as an architect, he became a member of the firm of Messrs. Croll & Gavin, Dundee, later having charge of their branch in Arbroath, where in 1891 he set up in business on his own account. He built up an extensive business, and executed many important contracts in Montrose, Arbroath, and other parts of Forfarshire.

We regret to announce the death at Newcastle, in his seventy-fifth year, of Mr. John W. Rounthwaite, formerly a well-known north-country architect, who had practised at Sunderland, Shotley Bridge, and Newcastle.

Houses for Disabled Men.

The British Legion are about to start upon a scheme for erecting houses in various parts of England and Wales to be occupied by disabled and ex-Service men. Already a substantial sum of money has been allotted for this purpose. The country has been divided into 11 areas for administration, and the houses will be erected in groups according to local needs. The whole of the organisation of the scheme is being carried out by the headquarters of the British Legion, and the architects are Messrs. Thomas & Wood, who were formerly Housing Commissioners of the Ministry of Health. Sites are now being acquired, according to the *Times*, and a start will be made as soon as possible. It is hoped that a number of houses will be completed and let at a very low rent before October 1, and the remainder will be erected without delay after that date.

The Wren Society.

The fourth (1927) Volume of the Society is now in preparation and will be issued to subscribers early in June. This volume is entirely devoted to Hampton Court Palace, and Her Majesty Queen Mary has graciously consented to accept the special dedication of the book in recognition of the life and work of Queen Mary II (1689-1694). The drawings of Sir Christopher Wren and Grinling Gibbons, reproduced for the first time in this volume, are of exceptional interest and relate to the miniature Versailles that was intended even more than to the Palace as actually built. The drawings fill fifty-one collotype plates and include a series of authenticated designs for fireplaces by Grinling Gibbons. The text comprises some seventy pages of Accounts, Letters and Official Documents for the publication of which special leave has been obtained. These papers are of great interest in showing the difficulties and pin-pricks that Wren was constantly beset with, and throw a light on the architect's relations with his official staff. As it is expected that the issue will quickly go out of print, early application should be made for this work, which can be obtained in return for the annual subscription to the Society of a guinea. The hon. secretary of the Wren Society is Mr. H. Duncan Hendry, F.R.I.B.A., of 53, Doughty-street, to whom all correspondence and applications for membership should be addressed.

COMPETITION NE

Private Houses Competition, Strode P Estate, Herne, Kent.

Three prizes of free sites, value £350, and £50, are offered for the best desig private houses at costs of £1,500, £800, and respectively, to be erected on the prize-wi sites. Particulars may be obtained on ap tion to the Secretary, Estate Office, Strode Herne, Kent.

Professor Charles Gourlay Memorial Sche

A meeting of the Committee for this sc was held in the Royal Technical Co Glasgow, on the 16th March, Mr. A. C A.R.I.B.A., presiding. The secretary rep that the sum of £87 had been subscribed to and that further contributions pract assured the sum of £100 being realised. Stockdale, Director of the College, expr the opinion that the time had now arrived the Committee might definitely move in matter of the memorial. A time limit t raising of the funds should be set as soo the definite scheme for the memorial cou settled.

Meantime it was unanimously agreed Messrs. A. Cullen and W. J. Smith be in to co-operate to prepare a design for memorial headstone and medallion, tog with the estimated cost for submission t next meeting of Committee, to be held i College on March 31st. By that time hoped many more subscriptions will have received. The Committee desire all students and friends of the late Prof Gourlay to have the full opportunity privilege of subscribing.

Rural Industries Exhibition.

The Rural Industries Sub-Committee Hertfordshire County Council, acting in junction with the Herts and Beds Di Committee of the National Master Fa and Blacksmiths' Association, announ Rural Industries Exhibition to be held a Hertfordshire Agricultural Society's Hatfield Park, on Thursday, June 9. E are invited in all or any of the c set out in the schedule from all memb the Herts and Beds Branch of the N.M.F B.A., or any other farrier or smith, wheel or saddler residing in the Administrative C of Hertford. The entry fee is 1s. for exhibit, payable at the time of entry. E must be sent on a special form to Mr. A. Herts Institute of Agriculture, Oakland Albans, from whom full particulars are c able. The last day for receiving entr May 21. The Worshipful Company of smiths offer a special prize, value £2 2s a medal, for the best exhibit of hand ham iron-work in the Smith's Section. prizes, value £1 10s., £1 and 10s., will be in each class, and a diploma will be aw for each exhibit which is of sufficient whether allotted a prize or not. S Section: Class 1, Agricultural implem part of an agricultural implement. C Wrought-iron gate or panel of fencing. C Scroll work. Any of the following arti Bracket or frame-work suitable for trad lantern, &c.; brackets for door porch. labra, gas or electric light fittings. C Door fittings. Any two of the follow Door hinges and hooks (plain or scr exceeding 30 in. in length, knockers, lett handles or latches, bell pulls, bolts, or o scraper. Class 5, Fire dogs, fire baske iron rests, set of fire irons, trivets, fire umbrella stands, log tongs, &c. Class fancy or decorative iron-work, not me above (*e.g.*, church furniture and weather vanes, sconces, candlesticks, forks, &c.). Class 7, Any plain iron-w mentioned above (*e.g.*, window frames brackets, fagotting bills, garden impleme Class 8, Any of the articles specified in C to 7 inclusive, made of wrought ir acetylene welded. Class 9, Any article iron, repaired by aceytlene welding. T also sections for wheelwrights' w saddlery.

Memorial Fountain, Star and Garter Home, Richmond, Surrey.

Sir Edwin Cooper, Architect.

CORRESPONDENCE

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

Acquisition of Chiswick House and Grounds.

Sir,—I notice in your issue of the 1st instant a letter by Mr. Maurice B. Adams, F.R.I.B.A., with reference to Chiswick House, and although Mr. Adams commands my respect as an architect I am bound to challenge the statements set out in his letter. It is interesting to note that Mr. Adams was one of those who, in 1918, helped to defeat the proposals of the Brentford Gas Company to obtain powers to acquire a large portion of the Duke's Meadows for the erection thereon of gasworks, and it makes one wonder with what poison he has been inoculated that Mr. Adams should now advocate the spoliation of the Duke's Meadows, against which he fought in 1918.

Mr. Adams is silent as to the offer made by the Barnes District Council to contribute something in the neighbourhood of £15,000 towards the cost of the acquisition of Chiswick House provided the Chiswick Council does not part with forty-five acres of Duke's Meadows for the erection thereon of the proposed generating station. Had Mr. Adams attended or read the account of the proceedings at the local inquiry, held by the Minister of Health, in October last, with regard to the Chiswick Council's application for an amendment of its Town-planning Scheme, he would have been aware of the terms of the offer made by the Barnes Council.

For his enlightenment, and also that of others, I may state that the proposal was that instead of exchanging Chiswick House for the forty-five acres of the Duke's Meadows the Chiswick Council should retain the forty-five acres required for the power station and continue to receive the sum of £1,500 per acre which is being paid by the Concrete Aggregates, Ltd., in respect of the sand and gravel from thirty acres of the site. The capital value of £1,500 multiplied by thirty is £45,000, and the suggestion of the Barnes Council was that this capital sum should be applied towards the purchase of Chiswick House, and that the Barnes Council would furnish the balance of £15,000, or such other sum as the Minister of Health should decide might be necessary.

In addition grants could probably be obtained from the London County Council and the County Councils of Middlesex and Surrey as was the case when the Marble Hill Estate at Twickenham was purchased for the public in order to preserve the view from Richmond Hill. By this means Chiswick would be able to acquire Chiswick House and retain the Duke's Meadows without having their amenities spoilt by the power station. This offer has never been seriously considered by the Chiswick Council, but was contemptuously declined at the local inquiry without its having been submitted to the decision of the ratepayers. I have made inquiry within the last few days, and have ascertained that the Barnes Council's offer is still open and will be renewed. This strikes at the root of Mr. Adams's argument that consent should be given to the erection of the super power station.

As to the various inaccuracies in his letter, I must point out that Chiswick House need not become a building estate, as the Duke of Devonshire, in the letter referred to at the local inquiry, has given the Chiswick Council the first opportunity of purchase, and this can be done in the manner indicated.

Mr. Adams's suggestion that the total area of Chiswick House and Duke's Meadows, 244 acres, would have to be maintained out of the rates is obviously inaccurate, as the sports grounds belonging to the clubs, the Civil Service and Fuller, Smith & Turner, are maintained by those clubs themselves. The Chiswick Polish Company are the freeholders of eighteen acres of the Duke's Meadows, and on a large portion of this they have laid out and maintain a sports ground for their staff. It is only on the northern portion of these eighteen acres that their factory will be erected. This factory will only contain one chimney for the boiler-house, and Mr. Adams's suggestions that the polish factory and the generating station are to balance each other is ludicrous. The proposed generating station is to have thirty chimneys, each over 100 ft. high, and with its buildings, coal parks, and railway sidings, and dock is to cover forty-five acres. The suggestion that the railway embankment would materially screen the power station from observation was shown by expert evidence at the local inquiry to be without foundation.

With regard to the last paragraph of his letter, Mr. Adams seems to suggest that Chiswick House grounds should become the home of athletic sports and pastimes, but with the exception of the existing cricket ground at Chiswick House the grounds are not suitable for use as a sports ground, and, as I stated in evidence at the local inquiry, Chiswick House grounds should be used as a park and not as playing fields.

H. N. Sherwin White.

KENT'S COLLIERY BUILDINGS

It is already possible to foresee the future of the new colliery villages that are rapidly being built in East Kent. A recent visit to Aylesham revealed a new town springing into life, and it is expected that the 400 houses now in course of erection will be completed by the end of this year. These houses are being admirably arranged on both sides of the valley. A broad boulevard is to run up the centre, leading from a railway station and civic buildings to a church at the further end. The houses are being well constructed by the Dorman Long Housing Company. Of those that are now being built, 50 per cent. have parlours as well as living rooms. All have three bedrooms with the exception of 48 brick houses. Special attention has been given to devising different types in order to avoid monotony. There is no standardisation. Half the houses are to be built in concrete and half in brick. Combinations of blocks of the different designs give eighteen types.

This new town is being erected by a public utility society. The Chairman is Mr. H. E. H. Rice, who has done so much for development in Kent, and half of the members are representative of the Eastry District Council and half of the Pearson-Dorman Long Company, All the houses are to be let. On the site, special attention is being given to providing amenities for the colliers and their families. Some 48 acres of ground have been reserved for playing fields and children's playgrounds. Here sports pavilions will be erected, and already the company have appointed Major Owen to take charge of the social and recreational work. There will be a large Institute with a stage for dramatic and operatic performances, a shopping centre, and sites have been reserved for the school and for a hotel.

The houses are built for the most part on a steel frame, and one inch of compressed cork has been fixed as a lining to the walls. Experience is showing the utility of this cork, which helps to keep the houses warm in winter and insulates the walls so that not so much noise can be heard from adjoining houses. None of the houses at Aylesham is yet occupied, and those miners who are now working down the Snowdown pit are for the most part housed at Woolage. This is a small hamlet one mile away from the pit, set in an area that teems with game of all kind, but this happy state of affairs is not likely to last for long! The houses face south with a delightful view across the country-side of Kent towards the sea. This pit was taken over in 1924 as a going concern, and since then has been entirely re-equipped with head-frames and electrical winding. The depth has been increased from 2,500 to 3,000 feet, and the men are now working in dry seams.

In conversation with some of the tenants of the houses we learnt that many of the men come from Derbyshire. In fact, every family in one road had migrated last year, during the period of difficulties in the coal industry, from Derbyshire to Kent. Usually the husband had gone on ahead in order to discover whether he could be taken on in the Kentish coalfields and then whether he liked new surroundings. Apparently they found a country unspoilt and congenial and sent for their families. As compared with South Lancashire, the absence of cinder heaps is very noticeable, and it is hoped that all the six collieries now being developed will cause comparatively little nuisance to the surrounding country, for all are to be electrically operated throughout, and thus there will be no smoke.

The difficulties of establishing new villages on out-of-the-way sites is, of course, very great. To an outside observer, however, it was strange at Aylesham to see some four hundred houses being constructed without roads, or, at any rate, foundations for roads, having been first laid down. In consequence, much of the ground was deep in mud, and much time and unnecessary expense must be incurred in bringing the necessary materials to the site and much inconvenience caused to the building trade operatives in reaching their work. No doubt the architects, Messrs. Abercrombie, Archibald, and Martindale, are by now fully aware of the difficulties that are being caused by the houses being built before the roads.

Another criticism was freely voiced by some tenants. They complained of the design of the houses with the bathroom upstairs instead of downstairs. One woman said that a bathroom upstairs was quite out of place in a miner's cottage. Her husband and her two lodgers carried muck and coal-dust that they had collected down the pit up the stairs and into the bathroom, and it was impossible to prevent the dirt getting into the bedrooms. It is intended in time to instal pit-head baths, but the English collier is conservative by temperament and prefers to take his bath in his own home.

The villages are well sited. In one case although only a few minutes' walk from the pits, the machinery is quite hidden out of sight by an intervening slope of the hill. At Aylesham only the tops of the machinery were visible. Thus the villages are likely to retain a rural aspect for many a year to come, provided the estates are properly managed.

City Livery Club's New Home.

The City Livery Club, whose members are drawn exclusively from the ancient City of London Guilds, has acquired the lease of part of the Chapter House of St. Paul's Cathedral. The house was built by Wren about 1712, at a cost of £5,000; to-day the building and site are estimated to be worth twenty times that amount. Formerly the clergy summoned to Convocation met and robed in the house and went across in procession to the Cathedral to attend a service in Latin before proceeding to Westminster. The building, says the *Times*, has dignity and simplicity. The ground floor has a large square panelled entrance hall, paved with plain white marble slabs. There are deep-set doors and windows in the thickness of its walls. A fine old table in the hall is as old as the house and is reputed to have been constructed from timber saved from old St. Paul's after the Great Fire. On the right of the hall is the apartment now used by the bank. A wide shallow staircase has beautiful wrought-iron supports to the handrails. The chapter room is on the first floor, looking out to the Cathedral and is remarkable for its dark old wainscoting and panelled walls. On the second floor is a spacious room with white panelled walls and deep windows, and a series of smaller rooms possessing the panelling and features of the Queen Anne period. In 1865 extensive alterations were made to adapt the house as a residence for the Archdeacon of London, and from that date until 1920 it was in the occupation of successive holders of that office.

AMERICAN APARTMENT HOUSES.—XV

By F. E. BENNETT, A.R.I.B.A.

Costs of Building.

BUILDINGS cost about twice as much as land in good residential parts of New York. The following tables show costs of two apartment houses:—

Partition walls—Tiles, 3 in. by 12 in. by 12 in., at 8 ft. 2; blocks, plaster, 3 in. by 12 in. by 36 in., at 5 ft. 2	·053
Alltrim (joinery) and kalamine, and finishing	·09
Total	$·65
Or, per cubic ft.	2s. 7½d.

The financial problems in the building of a block of flats, while they are not his immediate concern, must be readily grasped by the American architect if he is to satisfy his client. Sometimes it is necessary for him to work out "Financial Studies" of the building he designs, and even sometimes he will raise the loans and organise all the financing for his client. Indeed, the readiness of many architects in recent years to undertake this part of the work as well as the designing and erecting has tended to raise the status of the profession considerably in the eyes of American business men. Architects will now range themselves alongside financiers, real estate operators, and builders, and speak of their success in building enterprises; how they have operated so many schemes for the building of "apartment houses" and commercial buildings, and how they have had very few or no failures. They will speak of the ideals and the principles on which they have worked; how they have studied economical and financial factors and reduced them to definite quantities, and how they have recognised the dominance of the financial issue in all their schemes. They will speak of the "science of real estate values" or the "science of economics" which they are evolving. One prominent architect says: "The 'science of economics' is the American contribution to architecture. This is where the future lies. The plan and elevation are related to this æsthetically. The job must pay to be in relation to demand. The science has just started in America but has not penetrated to England."

They have certainly been in a position to arrive at real estate values, and to some extent they have done so, and they have certainly arrived at some standard values which are useful to themselves. It must be recognised, however, that their success is partially due to the rapid growth of their country during the last 20 years, and to the fact that the demand for commercial and flat buildings has been greater than the supply. Would-be tenants have been anxious to obtain accommodation, and building enterprises have had a good chance of success even in the hands of very unscientific organisers.

Under normal conditions of a settled district, where supply and demand are at equal level, the landowner sells for the price his land is worth; rent rates for a new building are practically determined by the other rents in the district, and the cost of building is fairly definite. This means that every new building only succeeds by drawing tenants from older ones. Up till now circumstances have been very kind to the speculators in America, providing them with very favourable opportunities, so that many successes have been possible. It is believed by some, however, that a crash may come soon, when there will be a glut on the market.

In the meantime there is no reason why a "science of economics" should not be developed, not only in U.S.A. but in England too. However, any attempt beyond the few notes given to provide information on the subject or to describe how the "financial study" is prepared is considered beyond the scope of these articles.

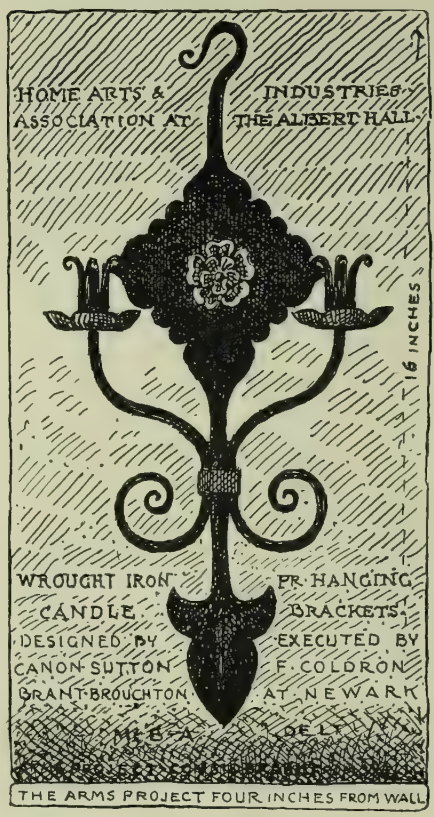
Co-operative Schemes.

A "Co-operative Apartment Building" is a block of flats managed co-operatively by the various occupants. In the first place a building corporation is formed by a syndicate, which contributes the initial capital and starts the scheme. Tenant owners, as stock purchasers, come into the corporation and buy out the original holders.

The idea has become popular during the last few years, and quite a number of large buildings are being run this way. Payments for stock purchased are made by the new owners as the building progresses. The scheme from the syndicate's point of view is just like an ordinary building enterprise, with 30 per cent. initial capital, except as regards risk. The syndicate may not be able to find a sufficient number of stockholders to justify going on with it. Then they can sell the land again, and possibly at a price to cover expense; and possibly not.

The maintenance costs for a tenant owner are 80 per cent. of what would be the rental value. This 20 per cent. saving eventually balances the original price of stock. The tenant is also saving money because the cost of his personal service is lower than it would be in a private house. He has control of his flat too.

Tenants in New York have been known to buy stock "on paper" by paying 30 per cent. of the value of the flat before building has commenced. It is said that in one case all the flats of a building were so sold thirteen months before they were ready for occupation. It is owing to this state of affairs that a syndicate can carry through an enterprise with very small initial capital.

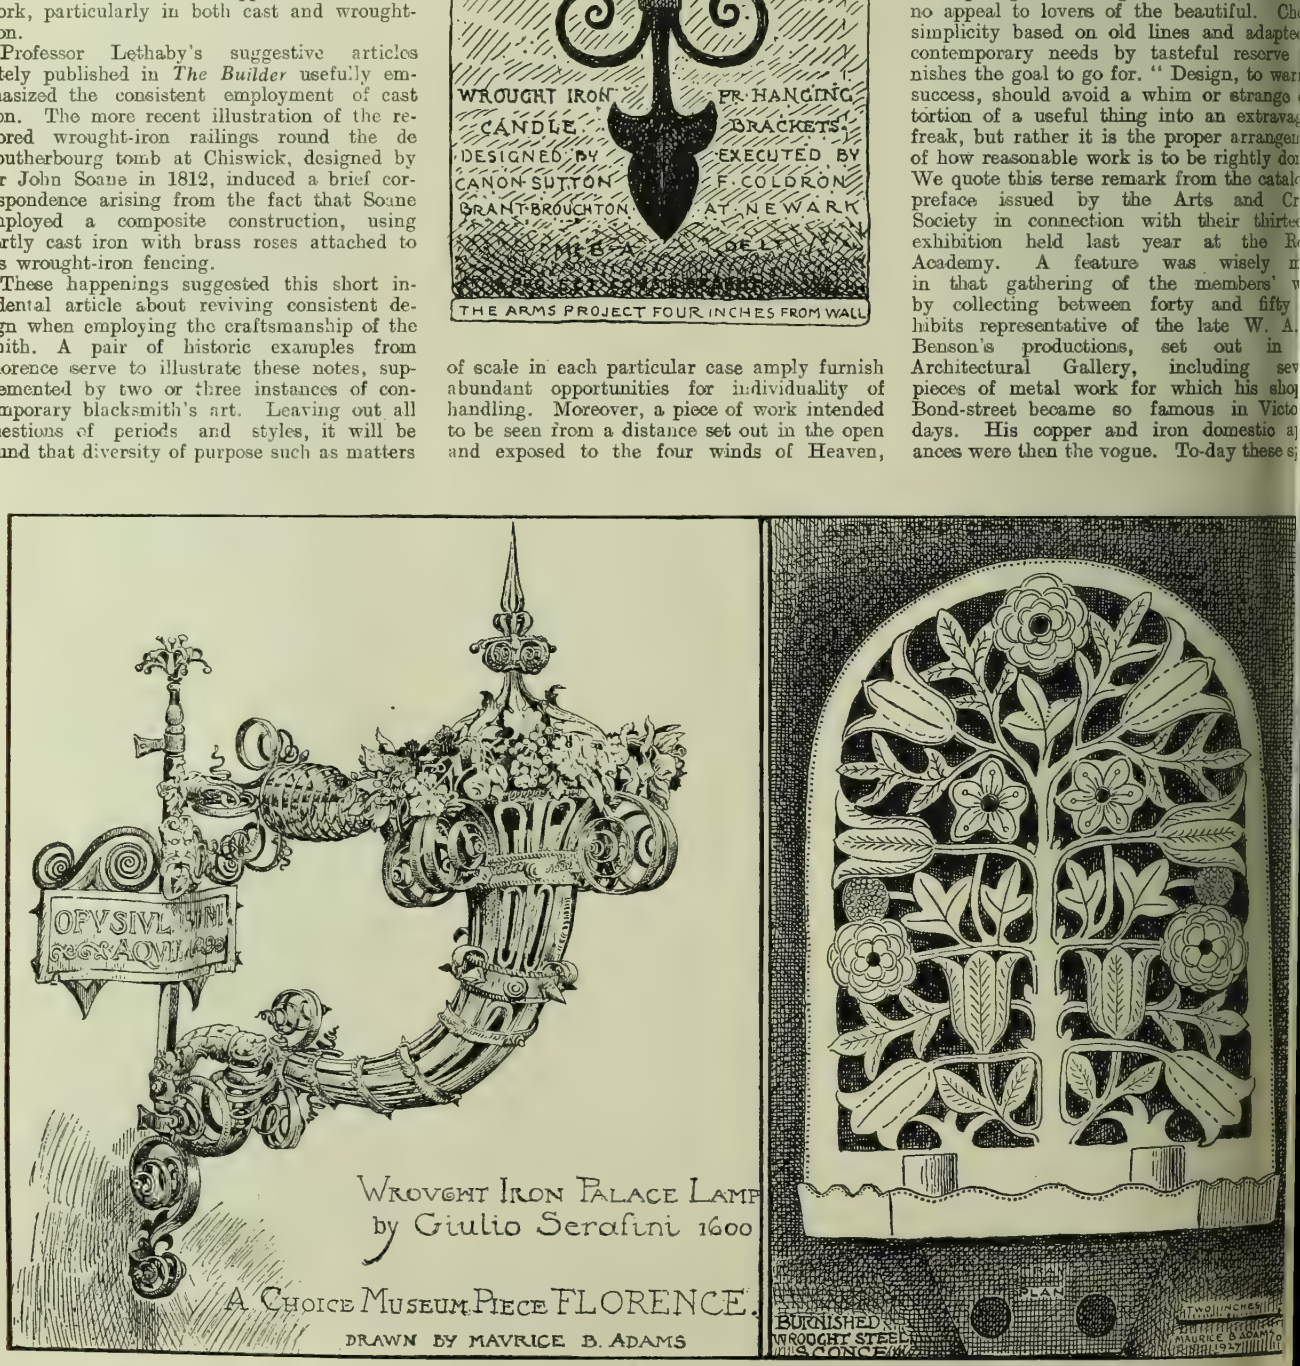


Old Bench End, St. Mary's, Haverfordwest, South Wales.

CONSISTENT DESIGN IN WROUGHT IRON AND METAL WORK

The recent conferences held at Conduit Street between architects and artificers to further a more intimate and active development of the allied arts contributing to building must be followed up by initiative, co-ordination and practical application. The question of Parliamentary registration concerns professional status, presumably instituted in the public interest although not necessarily insuring the production of good architecture. Without questioning the necessity of such a measure, it is manifest that the main consideration concerns material advantages rather than artistic advance, which is apt to become subordinated by mere business efficiency. Members more immediately concerned with the art side of their craft will do well to let no opportunity pass to keep alive the determination of our conferences to augment a co-operative spirit between the executants and the designers in all the details of decorative work incidental to architecture. In no branch is this partnership more needed than in the application of metal work, particularly in both cast and wrought-iron.

Professor Lethaby's suggestive articles lately published in *The Builder* usefully emphasized the consistent employment of cast iron. The more recent illustration of the restored wrought-iron railings round the de Loutherbourg tomb at Chiswick, designed by Sir John Soane in 1812, induced a brief correspondence arising from the fact that Soane employed a composite construction, using partly cast iron with brass roses attached to his wrought-iron fencing.



These happenings suggested this short incidental article about reviving consistent design when employing the craftsmanship of the smith. A pair of historic examples from Florence serve to illustrate these notes, supplemented by two or three instances of contemporary blacksmith's art. Leaving out all questions of periods and styles, it will be found that diversity of purpose such as matters

of scale in each particular case amply furnish abundant opportunities for individuality of handling. Moreover, a piece of work intended to be seen from a distance set out in the open and exposed to the four winds of Heaven, must be conceived on different lines from signs placed under cover and so seen close hand. Environment in all cases is of utmost consequence, while an appropriate c racter is essential either for a palace or a tage, a church or a municipal building.

Questions of cost, commonly the start point, ultimately are found to be of second import to the enthusiast engaged in cra manship. The employer, claiming to be authority in these matters, more than o creates a difficulty by being obsessed by dilections for periodic styles, refusing to mire anything not copied from the anti Such people are not willing to agree that mechanical or commercial reproductions, cuted under existing conditions, can n compare with a real piece of vital art or less based upon a sense of traditional sp Only such initiative capability can giv sense of real pleasure and furnish contin delight. An accomplished work of art is best investment.

On the other hand, the hope of turning something frankly novel and absolutely to date," generally results in a transi failure, tiring speedily, looking out of p by possessing no grip. Fakes are incap of inspiring an intelligent interest, and n no appeal to lovers of the beautiful. Ch simplicity based on old lines and adapte contemporary needs by tasteful reserve nishes the goal to go for. " Design, to war success, should avoid a whim or strange tortion of a useful thing into an extravag freak, but rather it is the proper arrange of how reasonable work is to be rightly do We quote this terse remark from the catal preface issued by the Arts and Cr Society in connection with their thirte exhibition held last year at the R Academy. A feature was wisely in that gathering of the members' by collecting between forty and fifty hibits representative of the late W. A. Benson's productions, set out in Architectural Gallery, including sev pieces of metal work for which his sho Bond-street became so famous in Victo days. His copper and iron domestic a ances were then the vogue. To-day these s

rought-iron Gates, Lowder Memorial aptistery, St. Peter's, London Docks.
. MAURICE B. ADAMS, F.R.I.B.A., Architect.

ns, treated as curios, seem to have lost ir stimulating charm, looking already old-hioned and odd.

Welby Pugin, the pioneer of applied design, omulgated with much the same insistence (in 1, when his "True Principles" and Contrasts" were published) similar dis-minations as to the need of consistent de-n in the application of cast-iron as con-sted with products from the forge and vil. He not unfairly depicted a specimen cast-iron railings done in the modern Gothic le, and compared it with a drawing of a diæval wrought-iron fence. For his pur-se this served, no doubt, but the contrast uld have been more justly effective by illus-ting a truly legitimate application of cast-n had Pugin given a detail of the pleasing randah fronts carried out under the influence John Nash during the days associated with Regency. Still existing in Marine Square Kemptown, close to the sea, they have suf-ed little from continued exposure. The few ought-iron fences remaining near by along Grand Parade at Brighton have during same period become so rusted that their erest has gone, and their use will soon be led by ruin.

In this relation to John Nash's influence at ighton by his erection of the Royal Pavilion l the use of cast-iron, it may be pertinent refer to the conversion, many years since the writer, when an art gallery, museum l public library transformed the Prince gent's stables into a modern institution. e Oriental style of this singular seaside ace, with its cusped and elaborated fenes-tion, was not easily adapted to an altered . The walls of the stables overlooking the dens were relieved by false windows as a ral treatment. These had to be opened up l utilized for lighting the new library ms. Cast-iron furnished the solution of the blem structurally employed as mullions, ped heads and transoms, glazed with plate ss. Masonry was impossible, and concrete s not developed as it has been since. The rounds of the existing work fixed the scale. l cast-iron facilitated the use of the Moorish racter imposed by the conditions. Inside premises the art gallery fronts and other ails were carried out for similar reasons cast-iron, the work being done in a local ndry, under the supervision of the archi-, who acknowledges the help derived from en Jones's "Grammar of Ornament," at t time recently published and still reckoned tandard work for reference.

n making a choice for illustration of masterpieces in wrought-iron, earlier periods than the nineteenth century must be depended on, and naturally preference both abroad and at home is given to the days of the Early Renaissance, going back to the triumphs of Benvenuto Cellini (1500-1570) in Italy, and his successor, Giulio Serafini, who, about 1600, produced some of the most exquisite wrought-iron imaginable, like his Palace Lamp, preserved in the National Museum at Florence. We give a drawing showing this choice example of unsurpassed skill, both in execution and design. The work of John Conway, Huntingdon Shaw, and Jean Tijou in England was somewhat later, like the splendid gates from Chiswick House (the production of Warren, the smith who did similar work for the colleges at Cambridge). They are now set up in Piccadilly, bordering on the Green Park, and were bought by the Queen Victoria Memorial Fund from the Duke of Devonshire, who had the gates set up at Devonshire House in 1897.

The silhouette given on page 635 shows the finial lion crowning the Palazzo of the Podesta at Florence, which is much earlier than either of the previously referred to examples, and obviously belongs to an entirely different category. The scale is masterful, and so well adapted to its position as here seen in mid-air from an aircraft photograph showing the Duomo of Florence and Giotto's Campanile in outline, suggesting relatively the proportionate sizes. The tower of the Palazzo Vecchio rises 330 ft. high and was built by Arnolofo di Cambio. The Via de Leoni on the east of this Palace commemorates the lions once kept in Florence by the authorities, partly in honour of William of Scotland.

The elevational sketch of an extremely well-handled and very simple wrought-iron hanging candle bracket shows the design of a gifted amateur, the Rev. Canon Sutton, who, although not mentioned in the "National Biography," must have been a talented man capable of producing so restrained and consistent an article in cottage use, so naive and direct in its design. F. Coldron, a Newark blacksmith, executed this pair of brackets, the only difference between the two being their hook reversed. The writer bought them from the Home Arts and Industries Association Exhibition held years ago at the Royal Albert Hall (somewhere in the eighties), when a vice-president of that enterprising society, started by its president, the late Lord Brownlow. The arms of the brackets curve outward and project four inches.

The most attractive and excellently designed burnished steel sconce of which a detail is reduced from a full-size drawing, was acquired from one of the exhibitions of the Arts and Crafts Society. Its interest, being free of ephemeral fashion, remains distinctive as a masterly example of the work done by the late Ernest Gimson, of Cirencester, Glos. The precise shapings and relative values of the perforations thus carefully delineated exhibit the crisp character of this wrought work so consistently produced. The steel plate was lacquered, and has kept its colour well. It would be difficult to find a better piece of patterning among work done at the present time anywhere of a like sort.

The wrought-iron garden gate at Rusper, Sussex, was executed by Messrs. Jones & Willis from the architect's full sizes.

The photograph reproduced on this page shows a pair of wrought-iron gates from the Lowder Memorial Baptistery adjoining the narthex of the church of St. Peter, London Docks, E. They are not intended to be exposed to the open air and serve to prevent intrusion into the Baptistery, the church being open usually all day. A circulation of air is thus insured at all times. The work was carried out from full size details by Maurice B. Adams, F.R.I.B.A., the architect who completed the adjacent Clergy House and erected this Baptistery. Messrs. Hart, Son & Peard were the craftsmen, who also did the rather unusually elaborate bracket and gearing for lifting the oak spire-like font cover, executed by Messrs. Farmer & Brindley.

Entrance Gate, "Little Benhams," Rusper, Sussex.
MR. MAURICE B. ADAMS, F.R.I.B.A., Architect.

Urban Developments in East Kent.

The numerous developments which are taking place in East Kent in connection with the exploitation of the new coalfields were recently described by Professor Patrick Abercrombie in a paper which he read at the R.I.B.A., a report of which was given in our last issue. This paper should be studied in connection with the illustrations given this week, which include a bird's-eye view and elevations of the new village of Aylesham (Professor Abercrombie in association with Messrs. W. J. Archibald and C. J. F. Martindale, architects) and a perspective view of a new inn at Chislet, for which Mr. G. J. Skipper is the architect. An article on the new colliery buildings in Kent is given on page 638.

The Star and Garter Home, Richmond.

We illustrate this week some new views of the Star and Garter Home, at Richmond, *apropos* of a visit to the building by the R.I.B.A., some account of which is given in a note on page 634.

The building was also illustrated and described in our issue for January 30, 1925. Sir Edwin Cooper is the hon. architect.

The Kendrick Girls' School, Reading.

This new school, which was opened by Her Grace, the Duchess of Atholl, D.B.E., M.P., on April 1, and which we illustrate this week, is named after John Kendrick, a wealthy clothier who resided in Reading towards the end of the sixteenth century. By his will, dated December 29, 1624, he bequeathed seven thousand five hundred pounds to the Mayor and Burgesses to purchase "a fair plot of ground within the town of Reading, and thereupon to build a strong house of brick . . . for setting the poor to work therein." After a period of success in which the art of clothmaking was carried on, the institution drifted into chaos, and in 1703 the looms were removed. A long period of mismanagement then ensued, culminating in 1849 in the wresting from the Reading Corporation of the major portion of the endowment. The portion left was then diverted to educational purposes by the Charity Commissioners under the Endowed Schools Act, and this property forms the endowment of the Kendrick Boys' and Girls' Schools, for the latter of which these new buildings are designed.

The site on which this school is being erected was the garden of Sidmouth House, part of the ancient estates of the Corporation, and is approached from the London-road. The site is almost a level one and the subsoil practically all gravel. The new buildings are arranged four blocks, in three of which the rooms are devoted to the ordinary subjects of a school curriculum; the fourth or central block contains the main assembly hall and gymnasium. The buildings are one story only, except the central portion of the southern block, which is two stories in height to emphasise the principal entrance. The classrooms are grouped around two quadrangles which will be levelled and sown with grass; open cloisters form the only means of communication. All rooms are fitted with French casements, opening on to the cloisters, which in suitable weather may be thrown open, thus converting the building into an open air school. The southern and western blocks are mainly devoted to classrooms, the eastern block to science rooms, the south-east corner of south block to a large botanical laboratory, and the central block to the assembly hall, gymnasium and changing rooms. Provision is made for 308 girls, but the plan is so arranged that further class rooms for about 100 girls may be added.

The buildings are heated by low pressure hot water, the boiler being placed in a basement so arranged that approach is possible from road level in Sidmouth-street. The various rooms, both in the new building and Sidmouth House, are fitted with radiators and efficient circulation is obtained by means of turbo-accelerators. Ventilation is natural, ample opening lights being arranged on each side of all apartments. The lighting is by electricity.

An attempt has been made to erect a simple, yet dignified building in plain local bricks giving emphasis to the principal entrance by Bath stone dressings. Internally the whole of the walling, except in assembly hall, is left with fair brick face coloured in quiet tone distemper. The assembly hall has a glazed brick skirting with deal panelling above to level of window cills, above which the walls are plastered. The cloak rooms, &c., have a glazed brick dado. The assembly hall has a pitch pine wood block floor, the gymnasium a teak floor, and other rooms ordinary deal boarding laid on breeze concrete. The general building contractors are Messrs. Malcolm & Leonard Fitt, of Reading; the clerk of works, Mr. C. H. Lanfear; and the school has been designed by Mr. Harry Hutt, F.R.I.B.A., of the firm of Messrs. Chas. Smith & Sons, architects, Reading.

Cottage at Wimereux, P. de C., France.

This cottage, erected for Captain Geo. H. Burnet, of Elrick, stands on rising ground overlooking the sea. The work was carried out by a firm of French builders, Messrs. J. Varlet et Fils, of Boulogne-sur-Mer. The walls are built with Marquise stone, rough cast above the base, the half timbering being of French oak, and the roof is covered with Beauvais hand-made brown tiles similar to our English tiles. Internally the walls are plastered and papered. There was some difficulty at first with the workmen in understanding the English form of fireplace and flues, but after careful explanation this was surmounted. The casement windows are of English pattern, and it was necessary to send over casement window fittings. Leaded lights were also sent over and created a great interest. The cost of the building was about £900 sterling, and worked out at about 7½d. per cubic foot.

Mr. John B. Mendham, A.R.I.B.A., is the architect.

House in Coombe-lane, New Malden, Surrey.

The facing bricks of this house are of a varied tawny orange colour with deep red dressings and moulded reveals and mullions to the windows. The sashes are steel, and the glass is in lead lights. The front door and hood are in oak, and the weather-boarding to the gable on the south front and elsewhere is in roughly sawn elm, barked. The interior joinery is in Columbian pine, treated with colour and finished with a satin surface. The floors are of Tasmanian oak. The north front faces the road. Messrs. Snelling & Rayment were the contractors, and Mr. Albert W. Moore, F.R.I.B.A., was the architect.

MEETINGS

Friday, *April* 22.

London Society.—Professor A. E. Richar on "London Street Architecture." At John-street, W.C.2. 5 p.m.

Saturday, *April* 23.

Association of Architects, Surveyors, Technical Assistants.—Visit to Southwark Ca dral. 2.30 p.m.

Institution of Municipal and County Engi —Eastern District Meeting, at Ipswich. a.m.

Monday, *April* 25.

Architectural Association.—Professor S. Adshead on "Regional Planning." 7 p.m

London Society.—Visit to Girls' Village H Barkingside. 3 p.m.

Royal Society of Arts.—Mr. J. W. T. W on "Measurement of Light (1)." 8 p.m.

Institution of Structural Engineers.—Di sion on "The Development of Rapid Harde Cements." 8 p.m.

Tuesday, *April* 26.

Royal Institute of British Architects.—Ex tion of Modern British Architecture. 3.30

Institution of Structural Engineers.—Mr. L Short on "Inspection and Testing of Steel Cement." At Chamber of Commerce, mingham. 7 p.m.

Institution of Civil Engineers.—Discussion "Bridge Foundations on Transported Cha with Notes on Piled and Monolith Foundati by Mr. J. Paterson Porter. 6 p.m.

Wednesday, *April* 27.

Institution of Civil Engineers.—An General Meeting of the Association of Lon Students.

Royal Society of Arts.—Mr. G. E. Keay "Fire Waste." 8 p.m.

National Housing and Town Planning Cou —Annual Conferences of Local Authoritie England and Wales. At Town Hall, M chester. 11 a.m.

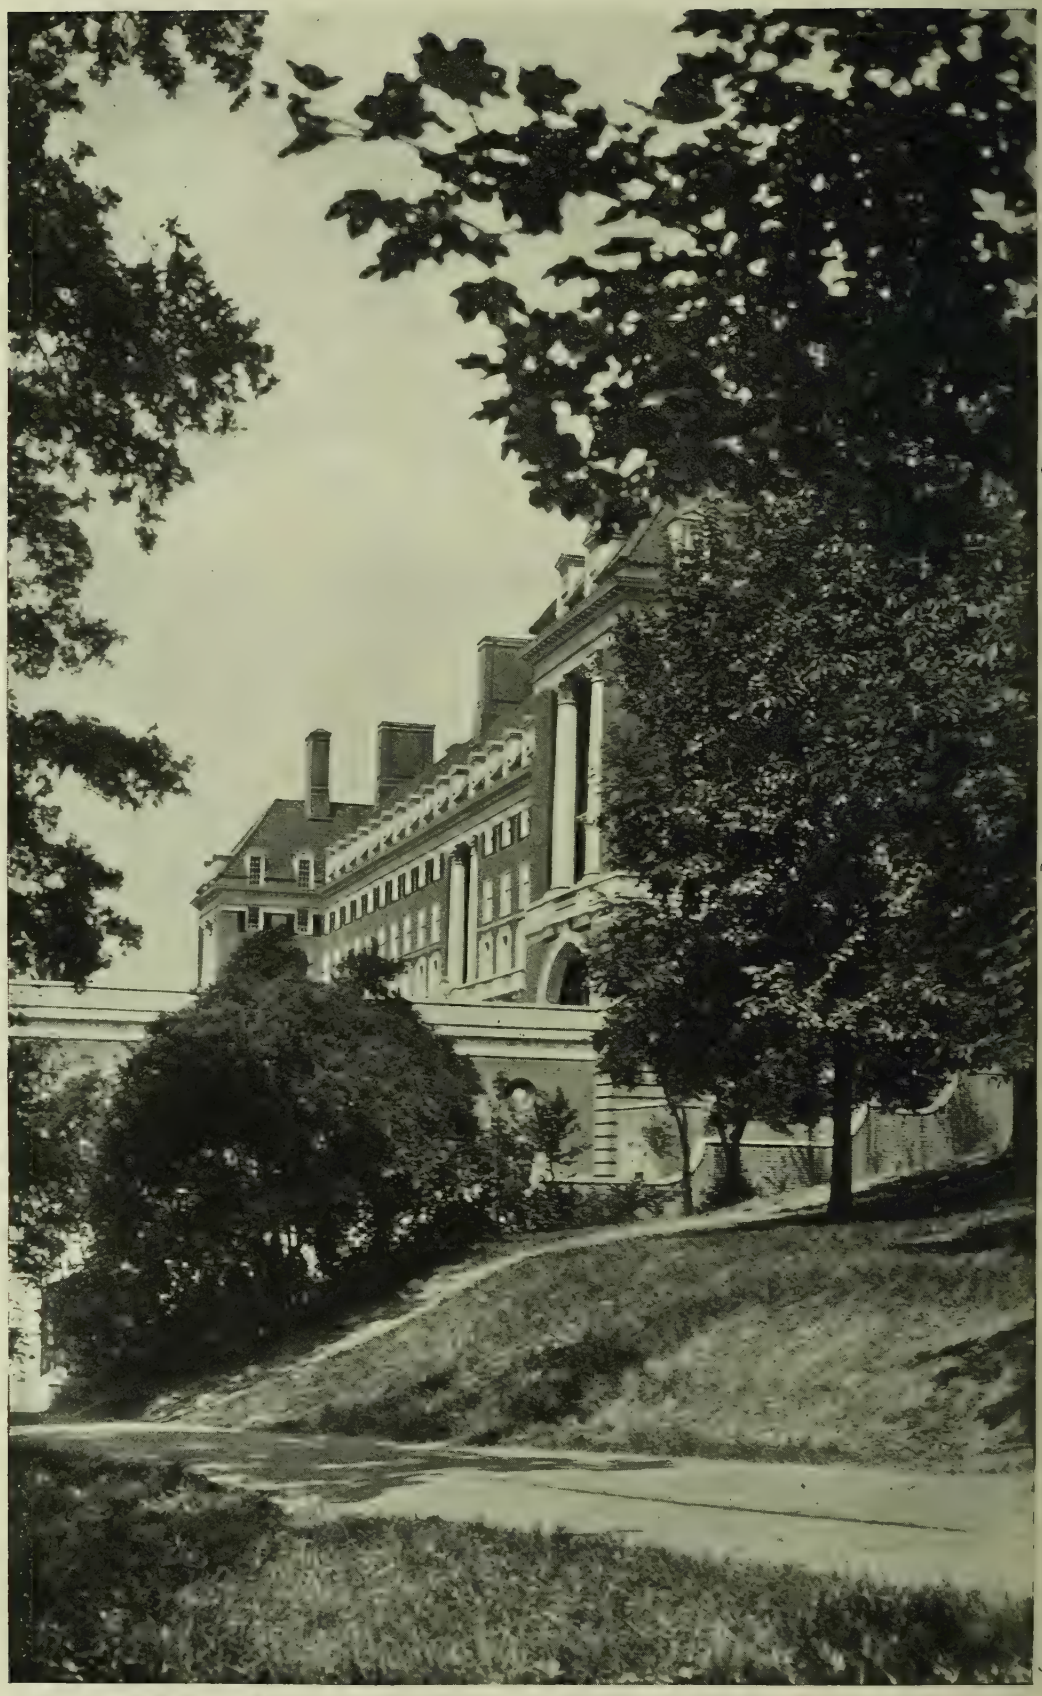
Thursday, *April* 28.

The Institution of Structural Engineers. Debate by Professor J. Husband and Ewart S. Andrews. 8 p.m.

Institution of Structural Engineers (York Branch).—Mr. A. J. Hodgkinson on "Pre Concrete Construction." At Leeds.

Institution of Municipal and County Engi —North Wales District Meeting, At Aber 11.30 a.m.

Friday, *April* 29.



University of London.—Professor J. Vogel on "Development of Ornament in Ir Art (1)." At School of Oriental Stu Finsbury-circus, E.C.2. 5.30 p.m.

Town Planning Institute.—Professor S Adshead on "Replanning Bloomsb 6 p.m.

Royal Sanitary Institute.—Discussion "The Housing (Rural Workers) Act," Messrs. C. E. Tangye, H. B. Mapleton, and Redfern. At Guildhall, Exeter. 2 p.m.

Suggested New City Street.

A committee of the City of London poration has been considering a suggesti make a new street from Giltspur-stre Aldersgate-street in order to relieve the in Newgate-street and Cheapside. The posal has been made by a private meml the Corporation, and the engineer has esti the cost at £500,000. The street would from St. Sepulchre's Church, cross the Office yard, and open land the property Bartholomew's Hospital. It would then King Edward-street and run along the side of Postman's Park. The proposal present in the suggestion stage, and the mittee has not yet agreed to submit it Court of Common Council.

PARTHENON STUDIES

By W. R. LETHABY

III.—Athens and London, 1800-1830.

British enthusiasm in the study of Greek reached the highest point of its curve in the y years of the nineteenth century. Clarke, iwell, Gell, Leake were working in Greece 1801-2. In 1802 the architects, William kins and R. Smirke, were in Athens. R. Cockerell followed with J. Foster in 0. Large collections of drawings were ight back, many or most of which seem to e been lost. A few of Smirke's drawings in the British Museum; an account of kerell's work is given in the *Hellenic rnal*, Vol. XXIX. Foster, just mentioned, ame an architect at Liverpool, but I cannot out what fate befell his drawings. There I believe, at the Museum a report on the ple at Bassæ, illustrated by his sketches. records of Greek study, see F. W. Has- in British School at Athens, Annual, III.)

ny complete account of the work of these n in Athens cannot be attempted here. My pose is to bring out, so far as may be pos- e, such observations in recording or eluci- ing the Parthenon as may have been first independently made by these and other tish students.

Clarke gives an excellent account of the nderful prospect from the Parthenon. The Acropolis of Corinth is so conspicuous n within the nave that the portal of the ple seems to have been contrived for ding the eye of the spectator to that point. e sea resembled a shining lake surrounded mountains." (Compare the similar view ough the Propylæum given in last part.) He noted of the Parthenon. "This building its entire state was lighted only by lamps. ong the remains of sculpture in the western iment the artists [of Lord Elgin] had ob- ved not only the traces of paint with which statues had been anciently covered but also gilding. . . It was usual to gild the hair statues which represented deities."

Gilded bronze had been attached to the lptures, "little bits of the bronze itself the matori had found in the work." Of the topes he observed "A person putting his nd behind the figures may perceive the ished surface."

He gave a delightful description of "Helios," the east front while it was yet in the row angle of the pediment. "To a specta- from below it seemed to be struggling to rst forth from an abyss."

Dodwell has some remarks on the use of our. He noticed the traces on the entabla- e of "shields, helmets, and other pieces of nour, probably those taken away by chares." He gives the first good drawing an antefix from the eaves of the temple, and ems to have been the earliest to remark that e lions' heads near the four corners of the ilding were not set on square but looked out- rds diagonally. Dodwell noticed some red our between the joints of the columns of the opylæum (being part of the testing for close ating). Gell has left a great number of topo- phical drawings and sketches now in the nt Room of the Museum Among these are spects from the west pediment of the rthenon to the east and the west; a drawing the temple which shows the marble beams the west portico; and a slight sketch of the nale figure in the right-hand angle of the st pediment.

Wilkins, in his book on Athens, published in 6, mentioned the entasis of the columns l gave an excellent general account of the struction of the temple. He argued inst Stuart's idea that the temple had n hypæthral. Light was only admitted to cella through the great doorway.

Wilkins wrote an excellent and sensible ay on the origins of Greek architecture, ich closely agrees with modern theories. ndles of canes or reeds bound together first gested in Egypt the idea of sculptured or ed support. The reeds grow tapering, and ce the bundle and the column also tapered. The Greek word *rabdosis* which signifies reeding, is found in the Erechtheum accounts applied to the fluting of columns.

In a later essay on the sculptures, Wilkins called attention to the fact that the reclining figure of the eastern pediment, still usually called "Theseus," was very like the Dionysos on the monument of Lysikrates, and he suggested this name for the Parthenon statue.

Michaelis says that Cockerell in 1810 measured the columns to determine the exact entasis which had already been observed by Wilkins. "This entasis is a slight expansion of the outlines which, in the columns of the Parthenon having a diameter in the lowest drum of 1.90 metre, amounts only to 17 millimetres on each side and is of vast importance in giving life to the outline."

Cockerell knew of the limestone patch on the central axis of the marble paving of the cella, and understood it to mark the site of the pedestal of the great gold and ivory statue. His restoration of the plan of the cella with its internal columns, given in Bröndsted's work, 1826, and in *Museum Marbles*, 1830, agrees with the data given by Woods as mentioned next. Cockerell supposed that there were only 16 internal columns, but this, as now known, is too few. Unfortunately he resumed and rehabilitated the theory of lighting the temple through an opening in the roof.

In 1816 the fourth volume of *The Antiquities of Athens*, ably edited by Joseph Woods, was published. Woods included engravings of the Nointel drawings, and compared the sculptures with them. He thus settled the place of three large fragments of figures in the western pediment on the left of Poseidon (our right). "There are fragments of what I suppose to be the three following figures. The first [now Iris] has a metal girdle; the second [now Amphitrite] has a broad girdle marked on the stone, no part of the thigh is exposed, but it is broken off scarcely below the place marked in the drawing as the junction of the garment; of the third there is nothing remaining but the lap and what seems to be the leg of a child in her right arm."

In this same year appeared Visconti's account of the sculptures in which we have seen the figure of Iris was mistakenly assigned to the east pediment; of course the foreign scholar had to be accepted, and Woods' correct identification was neglected until after nearly a century it was forced back on the Museum authorities by foreign scholars. One of our main failings in these questions seems to be holding on to lost causes and not knowing when points are proven.

Woods visited Athens in 1818. In the British Museum collection of his papers (Add. 22152-3) are several accurate drawings made by him. One is a careful study of the roofing system of the Parthenon. This shows the construction next to the lower angles of the pediments. There was an antefix over every triglyph and one between each of these divisions; the antefixæ were detached and did not correspond to the marble tiles, of which there were three to every two of the antifixæ. Another drawing is a valuable plan of the paving of the temple. Although a large part of the cella was still occupied by a Turkish mosque "the rough limestone" area which was covered by the basis of the great statue of Athena is indicated; so are the positions of internal columns. "The stones coloured yellow are 14 or 15 inches thick; the others from 8 to 9. All seem to be bedded on rough masonry or on the native rock." This plan is dated February, 1818.

That these drawings were the work of Woods is confirmed by the account of the paving of the Parthenon given in his *Letters of an Architect*, 1828. He was in Athens from February to May, 1818, and met there Lusieri and Fauvel. We have seen that the floor area had been cleared by Lord Elgin's agents. As Woods does not claim to have observed the evidence for the situation of the statue and columns for the first time, the discovery must have been made when Elgin's party uncovered the white marble floor. Woods says that there were four blocks of stone 5 ft. 8 in. square in the floor of the opisthodomus on which columns had stood. "The cella floor was covered by marble slabs 8 in. thick. A course of thicker stones 4 ft. wide and 14 in. thick formed a basis for internal colonnades. It is this course and the four large stones in the opisthodomus which are coloured yellow on the plan. Within this course in the cella, about 15 ft. from the walls, the central portion was sunk a little. At one angle of this series of slabs [the thicker course] are faint traces of a column about 3 ft. 9 in. in diameter; and we may ascertain that the [normal ?] distance from centre to centre was about 11 ft. 6 in., while in the other intervals [next the angles ?] the space from centre to centre was 12 ft. 11 in." As remarked in regard to Cockerell's plan, such a spacing of the columns is much too great, but the record of the traces of an angle column is valuable. It is sketched on the plan at the N.W. corner. "Within the sinking of the pavement already mentioned we find again the 8-in. marble paving, but in one part slabs of limestone occupy its place. These are supposed to have supported the statue of the goddess." The exact position of one angle of this limestone space is indicated on the plan; the rest was covered by the mosque. Hence it was that in Cockerell's plan the statue base, while shown in the right place, is more square than its proper form. The pivot holes and quadrants for the double doors at the west are shown on the plan, and in the cella behind the statue basis in the centre of the transverse row of columns is a group of four holes in which some object must have been fixed. In restored plans a column occupies this position.

According to Woods' *Letters* "The ceiling of the pronaos and posticum was formed by marble joists supporting slabs which contained lacunaria, but in the lateral peristyle these slabs were laid from wall to wall without joists."

On the exterior he noted the traces of the shields once on the architrave. "There is occasionally a slight green circular stain produced by the edges of the shields. They were about 3 ft. 6 in. in diameter. Under each triglyph are holes by which the bronze letters of an inscription were fixed." Everyone agrees that the shields were bronze, but the evidence of the green stain is important. The traces were noted of external painting and gilding. The spaces between the columns of the pronaos were filled with a metal grating on a marble cill. The doorway was 16½ ft. wide without any frame. "We may conclude that this part was of metal as in the Propylæa." On the floor were indents which had probably been filled with metal plates for the opening of the doors. The pivot holes were clear of the walls. Evidence for bronze door frames in the Propylaea is given in detail. The general account of Athenian buildings is full and informing. Altogether this is a delightful book. Woods also wrote *An Essay on Modern Theories of Taste*, 1808.

For the plan of the cella see also the second edition of Stuart's *Antiquities*, edited by Kinnard (1825-30, II, p. 39).

The first Synopsis of the Museum Sculptures was published in 1817. Taylor Combe, the editor, was, I believe, the first to give the names Helios and Selene to the chariot groups formerly known as Hyperion and Night.

In 1817-18 H. W. Williams made some excellent landscape views of Athens, which were engraved and issued in a really beautiful volume—the originals are, I believe, in the Print Room of the British Museum. Inwood was working on the Acropolis, specially studying the Erechtheum about this time. In 1818

Athens was visited by the architect, G. L. Taylor, who is said to be the author of some excellent water-colour drawings of the Parthenon and panoramic views of the city, now in the Victoria and Albert Museum. In an autobiography published many years later it appears that Taylor was only in Athens a short time, and he does not speak of having made any careful drawings. I therefore feel some doubt as to the authorship of these excellent drawings, although one of them bears the date 1818.

The exquisitely minute restored reproductions of the frieze by Henning, which he is said to have carved in slate, was begun about 1820. Cockerell spoke of it as "a beautiful restoration." Interesting references to it may be found in *The Builder*, 1877.

The Rev. E. J. Burrow, in a little volume on the sculptures, dated 1837, of which, however, there was, I believe, an earlier edition, compared the composition of the central group of the west pediment with the coin of Athens, where Athena and Poseidon stand on either side of an olive tree, and he suggested that probably such a tree rose in the centre of the pediment. He seems to have been the first to mention in connection with the east pediment the relief of Zeus and Hephaistos, illustrated by Winckelmann. He gave good descriptions of the figures and noticed "the profusion with which ornaments, most probably gilt bronze, were lavished." He brought out the arguments for the sculptures being accepted as the works of Pheidias.

Donaldson (1795-1885) studied in Greece about 1820 and did some work on the Parthenon. According to Penrose it was Donaldson who first observed the inclination of the axes of the columns of the peristyle. He brought back some of the glass beads from the capitals of the Erechtheum and scales of colouring matter. A book of his drawings is in the Institute Library.

With him may be mentioned Wolf, another architect, who worked on the Parthenon and left a very interesting collection of drawings, also at the Institute; these are largely of constructive details.

The illumination of the structure and sculpture by gay colour and gilding was established by a long series of observations some of which, such as the descriptions of Dodwell and Woods, have already been mentioned. An important contribution was made by Lewis Vulliamy, working in Greece from 1818 to 1821, who published an engraving of the painted pattern on the cornice of the pediment. "The cymatium of the raking cornice of the Parthenon has been conjectured to have been painted, but no one has before discovered or made known any of the ornament. This specimen is drawn from two fragments, one of which was a piece of the angle; the painting was much obliterated, but enough remained for one part to supply what was wanting in the other." It seems to have been Vulliamy's discovery which was referred to by an American visitor to Athens in 1835. "I clambered up to the very apex of the pediment and, lying down, leaned over and saw under the frieze [?] the acanthus leaf [?] delicately and beautifully painted on the marble, and, being protected, still retaining its colouring. It was out of sight from below and had been discovered by the enthusiasm of a young English artist." (J. L. Stevens' *Incidents*, etc.) In 1826 Angell and Harris published an account of their discoveries in Sicily with some records of colour decoration. The bright glitter of the temple as it was when new born from the brain of Pheidias was well suggested by the Rev. C. Wordsworth, who visited Athens in 1833. "From the parts still standing and fragments on the ground the architect will restore the temple in its original beauty, symmetry and colour. The meander winding beneath the cornice [of the cella], the honeysuckle ornament sprouting below the pediment, the shattered plate-band of a triglyph which he lights upon tinted with azure, and the guttæ of the same hue, looking like real raindrops, will furnish him with sufficient elements." C. H. Bracebridge, writing from Athens in 1836, told Wordsworth of archaic fragments recently found by excavation. "Remains of painted figures and heads, and especially fragments of columns, triglyphs, and capitals which still retain their original colours, blue, red and the brightest ultramarine. The capital in the Theseum and vestiges about the Erechtheum show that the temples were in part coloured, but no proof has been given before the discovery of these primitive Attic remains that bright and highly contrasted colours were used generally on marble edifices."

This overwhelming evidence of the liberal use of colour was for a long time ignored or recognised with pain as rather scandalous. About 1830 a committee was appointed to inquire into the evidence, and their interesting illustrated report is printed in an early volume of the sessional papers of the Institute. The use of colour had to be proved against the tastes and opinions of learned men. The editor of the small second edition of Stuart's *Antiquities* (1841) writes: "There is a circumstance recently ascertained to its full extent which gives contradiction to our notions concerning the purity of Grecian taste and its antipathy to coarseness. The Greeks *painted their temples* not merely in subdued but with glaring colours, reds and blues and yellows. Nay, there is a shrewd suspicion that the sculptures were painted like the figurehead of a man-of-war. And unluckily the evidence for these incredibilities is exasperatingly clear; the statements of the German architects employed by King Otho, and the details given by Mr. Bracebridge leave no doubt of the facts. Still, we have doubts respecting the date of the practice. We cannot believe that the architects of the best days of Greece would select the purest materials in the prospect of a mask of tawdry colour. Neither is it probable that if this vile practice had existed in olden time, no hint of it should occur in Pausanias or Vitruvius. That Ictinus, to say nothing of Pheidias, practised these atrocities while Pericles approved can only be believed—*quia impossibile est.*

Major, afterwards Colonel, William Martin Leake, sent on a military mission to Turkey early in the century, began a thorough exploration of Greece. Leake had a special genius as well as indefatigable zeal for topographical research. He was associated with Hamilton in bringing the Elgin marbles to England. Born 1777, elected to the Dilettanti Society in 1814, he died 1860.

Leake, in 1821 first opened the way to the full explanation of the sculptures of the west pediment by showing that the spectator figures behind the chariot of Athena were Cecrops and his daughters. In 1841 he extended the scheme and proposed to put figures in the two "gaps," one on the left-hand side, the other on the right. He observed of the metopes that the Centaur subjects were only on the south side; for the rest "the fabulous wars of the Athenians supplied part of the subjects."

He was the first to identify the six gods who form the group on the left of the centre of the east front.

His work in regard to the west pediment has hardly yet been absorbed. His demonstration in regard to the group of gods (partly founded, as we saw, on the observations of the veterinary surgeon that a pair were not twins and that another had his foot against a staff) was long resisted. In Vaux's *Handbook*, 1851, we are told of the figures which Leake ten years before had shown must be Hermes and Dionysos: "The two young men were Castor and Pollux. The nearer one has been conjectured to be Mercury on the ground that the figures are of different ages." The spear staff of the other figure is not even mentioned, and its old name is maintained. Furtwängler named the figures as Leake had done, but so late as 1903 Dr. Murray was still undecided. He continued to suppose, however, that Hephaistos had a "club foot," an idea that goes back to Stuart's misunderstanding of another figure. I refer to these points as examples of our conservatism; Dr. Murray was really a very able man who did much for the department under his charge. In the *Guide* 1908 Leake's identifications of 1841 were adopted by way of Furtwängler.

An account of the Parthenon and its sculptures appeared in a volume of *Marbles* issued in 1830, which was edited Cockerell. It was followed by volumes the Metopes (1835) and the Frieze (18 by Hawkins. These were all illustrated admirable engravings from drawings by bould, which were entirely exquisite in tender truth. After a century of change impossible to discern the least fault in subtle essence—expression. Being an off work they have not been appreciated as they are—about the most perfect illustr books ever produced in England. The vol of 1830 was illustrated with a plan elevations by Cockerell. The plan already been mentioned. The restoration the sculptures in both pediments have ha been improved. Athena is near the ce of the east pediment, as an important st ing figure, but this had already been gested by Elgin's party as shown by a d ing in the Museum.

Cockerell, or more probably Corbo established the existence of a second chari that of Poseidon—in the west gable. " necessity to counterbalance the Car of tory [Athena's] is apparent; and the va space indicated in the drawing of C clearly shows that such a one once existe The charioteer on this side was Amphit and her car was accompanied by "a fe who assists to guide the horses"—tha the figure we now know as Iris.

It was recognised that, as Stuart had s the left-hand gap in the western pedi between the reclining male and Cecrops w require a figure to fill it and one was inse in the restoration. This conclusion was resisted, but it was taken up again by L wängler, who also adopted Leake's view there must have been a figure in the r hand gap as well.

Corbould's original drawings are f nately preserved in the Print Room, amongst them are one or two which never engraved. Hawkins wrote of the a "To his close examination of the sculp and to his just discrimination of their va merits, the author feels much indebted many illustrative remarks." It was pro Corbould who first suggested that Pos had a chariot similar to that of Athena i other half of the pediment. Westm (1831), having mentioned the latter, go to say: "This group was evidently bal by the chariot of Neptune [Poseidon], is not possible to account for so gre space without it; and Mr. Corbould, has examined Carrey's drawings wit greatest attention, finds it [the hypothesis ported by the two figures which next app One of these was "Amphitrite" (see *Elgin Marbles*, 1833). Cockerell is he mentioned, and in a restored west view temple made by Cockerell and engra H. W. Williams's *Select Views in* 1829, the second chariot does not a Of the east pediment Westmacott point that the startled female could not be Iris goddess being always represented with

Hawkins himself brought out the fac the girls in the middle of the east carried stools instead of baskets, as ha viously been said. The frieze, he bel was sculptured in place. The w metopes had reference to the Athenia tory at Marathon.

One would have thought that so soon had been pointed out that the girls stools that would have been settled, Vaux's *Handbook*, 1851, we are told they bore "unascertained objects, appa stools. In the procession maidens stools, but these occupied a subor position. We should rather expect to fi Canephoroi." A good example this of guity rather than of bold denial or, still, frank acceptance.

SOCIETIES AND INSTITUTIONS

YORK AND EAST YORKSHIRE ARCHITECTURAL SOCIETY.

he annual general meeting of this society was on April 12. The following officers and ncil were elected for the year 1927–28:— ident, Mr. J. Stuart Syme, L.R.I.B.A.; -Presidents, Mr. W. S. Walker, F.R.I.B.A., Alan E. Munby, M.A., F.R.I.B.A., Mr. G. D. bron, F.R.I.B.A.; Hon. Treasurer, Mr. E. Pollard, L.R.I.B.A.; Hon. Auditors, Mr. Reid, L.R.I.B.A., and Mr. S. G. Highmoor, ; Hon. Secretary, Mr. R. Jackson, I.B.A. Council: Mr. H. Andrew, I.B.A., Mr. W. E. Wiscomb, Mr. A. B. eigh, Mr. J. M. Dossor, F.R.I.B.A., Mr. F. J. h, F.R.I.B.A., Mr. S. R. Kirby, L.R.I.B.A., L. Kitchen, F.R.I.B.A., Mr. C. Leckenby, I.B.A., Mr. S. Needham, L.R.I.B.A., Mr. A. ard, F.R.I.B.A., Mr. F. Porteous, Mr. J. E. , L.R.I.B.A., Mr. T. Snowden, L.R.I.B.A., A. N. Thorpe, Mr. T. W. Whipp, A.R.I.B.A., S. Wilkinson, A.F.C., F.R.I.B.A.

he prizes awarded by the Society were pre- ed as follows:—

easured Drawings Prize: Mr. S. A. Suggett, borough; Mr. R. A. Pratt, Scarborough.

ize for Measured Drawings of an Old Bridge rchitectural Interest: Mr. H. R. Stott, York.

. Munby's Prize for the Best Essay on Local y of Stone: Mr. J. G. Davies, York.

he Society has a membership of 110, including members.

he retiring President in his address referred he activities of the Society during the past on, and spoke with satisfaction of the large ease in membership during recent years.

he new President expressed the gratitude of members to Mr. Dossor for his untiring ts in promoting the interests of the society the welfare of the profession during his of office, and for the very able manner in h the latter had conducted the affairs of the ty. He also spoke with pleasure of the y co-operation which existed between the bers from York and Hull. In referring to Registration Bill now before Parliament, he essed the opinion that the arguments in ort of the claims of the profession are swerable and that nothing of any serious ht had yet been advanced against these s by those who had set themselves in sition to them.

he new President, Mr. J. Stuart Syme, I.B.A., is a partner in the firm of Messrs. ley & Rutherford, of York.]

ASSOCIATION OF ARCHITECTS', VEYORS' AND TECHNICAL ASSISTANTS.

number of members of the A.A.S.T.A. d the works of Messrs. Siemens Bros. Woolwich-road on Saturday afternoon, th inst. Mr. Southey, architect to Messrs. ns Bros., conducted the party through the shops. Before the tour commenced an photograph of the works was shown to the rs to enable them to appreciate the growth works since 1865. Commencing with the workshop, the various processes of cable- g were inspected. In the more modern shops the difference in construction was ent, the floors all being constructed in rein- l concrete and finished with composition ng, and the increase of window area was notable feature. In the latter workshops onstruction of the various parts for the new natic exchanges was found to be of great st. The visit was concluded with tea, at Mr. Weeble, on behalf of the A.A.S.T.A., ed Messrs. Siemens Bros. and Mr. Southey eir courtesy in allowing and conducting the Mr. Metcalfe seconded the vote of thanks Mr. Southey replied.

HE INSTITUTE OF BUILDERS.

forty-third Annual General Meeting of stitute of Builders was held on Wednesday, 30. The accounts and balance sheet for ear ended December 31, 1926, showed satisfactory position. The report of the Council outlined the progress that has been made with the Institute's educational policy, and referred to the increasing desire of students to present themselves for the Institute's examinations. The scheme of medal awards for the encouragement of the study of general building industry subjects had been revived for the past year. The Council acknowledged the receipt of donations to the library fund, which, together with a grant from the Institute's funds, will be expended upon the purchase of books to form the nucleus of a technical reference library for the industry. Other sections of the report dealt with the Institute's activities overseas, and the activities of the Licentiate Discussion Club.

The following officers for the year 1927–28 were elected:—

President, Mr. S. Guy Sapcote, F.I.O.B. (Birmingham).

Vice-President, Mr. R. A. Costain, F.I.O.B. (Liverpool).

Hon. Treasurer, Mr. A. J. Forsdike, F.I.O.B. (Sheffield).

The following members were elected to the Council:—Mr. G. Gee, F.I.O.B. (Derby); Mr. F. G. Hodges, F.I.O.B. (Burton-on-Trent); Mr. E. W. King, F.I.O.B. (Newport, Mon.); Mr. G. H. Parker, F.I.O.B. (London); Mr. R. L. Roberts, M.A., F.I.O.B. (London); Mr. B. C. Aldous, A.I.O.B. (London); Mr. J. H. Barker, A.I.O.B. (Hitchin); Mr. H. R. Middleton, A.I.O.B. (Yarmouth).

Mr. Sapcote, upon taking the chair, thanked the members for their expression of confidence in him, and dealt briefly with the programme before the Council and the status of the Institute in the industry.

The Council's report upon the Architects (Registration) Bill and their decisions were discussed, as was also the Institute's Benevolent Fund.

South Wales Branch.

At the annual meeting of the South Wales Branch of the Institute the following officers for the year 1927–28 were elected:—

Chairman, Mr. I. J. Chorley, F.I.O.B.

Hon. Treasurer, Mr. P. W. T. Rendell, A.I.O.B.

Hon. Auditor, Mr. W. F. Bibson, A.I.O.B.

The report outlined the activities of the branch for the past year, which included the arrangement, in conjunction with the South Wales Institute of Architects (Central Branch), of an interesting series of lectures. The Institute's medal awards to the schools for the encouragement of general building industry subjects have been augmented by the award of special prizes to students of the Cardiff, Newport and Swansea Technical Colleges, as well as prizes for studies in the building crafts. The report referred also to the work of Mr. A. E. Jenkins, F.I.O.B., who, as chairman of the branch during the past year, rendered invaluable services to the Institute and its activities in South Wales.

Visits to Works in Progress.

Through the courtesy of a number of London contractors the Institute has been able to arrange, for the benefit of the students of the Building Classes of the Acton and Chiswick Polytechnic, an interesting series of visits to works in progress. These visits have a great educational value, and are much appreciated by the staff and the students. A few instructional hours spent by students on a building site are invaluable, since examples of modern building methods and the uses of new building materials cannot readily be demonstrated in the lecture room.

The Delphi Excavations.

Further archæological discoveries are reported from Delphi, where a marble head of the Emperor Marco Avrilios, together with an important fourth-century inscription and a quantity of pottery, have been found. The inscription and pottery, it is stated, probably belong to the Treasury of the Athenians.

THE LONDON COUNTY COUNCIL

The London County Council at a recent meeting dealt in detail with certain estimates which had already been approved in bulk. The principal capital requirements submitted had reference to improvements, main drainage, and mental hospitals. The estimate of the Improvements Committee (£1,050,000) included £100,000 for the reconstruction of Waterloo Bridge and £100,000 for Lambeth Bridge. Mr. E. G. Culpin moved an amendment asking the Council to vote £100 for an inquiry into the London Building Acts and the position of district surveyors. He said the consolidation of the London Building Acts was necessary. It was difficult for builders and architects to find what was expected of them, while the Building Acts Committee itself found questions which were raised very difficult to decide. The office of district surveyor was an anachronism. It was paid by fees, and in one case a district surveyor over a term of years obtained an average yearly income of over £5,000. District surveyors should be under control of the Council and should be paid salaries.

Mr. W. Ray, while expressing sympathy with the objects of the amendment, said the time was not opportune for such an inquiry.

The Council rejected the amendment. Mr. C. A. G. Manning asked for an allocation of £500 for the promotion of legislation to prevent the London squares from being built upon. He said successive Councils had been deeply interested in the matter, and an Act was secured which protected many squares. That Act did not go far enough. The time had now come when all the squares should be protected.

Mr. Ray replied that a resolution would be placed on the next agenda of the Council asking the Government to set up an inquiry, in order to secure that information not in the possession of the Council should be obtained.

Mr. Herbert Morrison said the Council had already spent three years on inquiry, and the facts were well known. Mr. John Scurr had drafted a Bill which provided that the squares should not be built upon.

Mr. Manning declined to withdraw the amendment, which was lost on a division.

Sir Percy Simmons informed Mr. J. D. Gilbert that tenders in connection with the works on the Lambeth Bridge approach had been invited, and were due. He also said that two blocks of land, having an area of about 79,000 ft., at Kingsway and Aldwych, had been available for building for about 20 years. The Council's yearly rent roll from sites already let on the area of the improvement was about £105,000. Arrangements for letting a site for offices for the Indian Government had been completed and the Committee had other negotiations in hand.

Remains of Early London.

The committee in charge of the Museum of the Corporation of London (Guildhall Museum), have recently started a scheme for the effective survey of the ancient structural remains of early London as they are revealed by modern building operations. The Councils of the Society of Antiquaries and the Royal Institute of British Architects, together with the authorities of the British Museum and the London Museum, have all readily given their support to the project, and already the work is taking definite shape. Briefly the scheme is to record on a large-scale map of the City of London the details and measurements of all authenticated discoveries as they occur, before the requirements of modern building improvements obliterate these relics of the past. It is hoped, too, that in time it will be possible to transfer to this plan the vast amount of valuable information on this subject scattered (and often forgotten) in the various archæological publications of the last fifty years. The plan will become in time the most valuable storehouse for knowledge of the site of Roman London.

BOOK REVIEWS

Artifex; or, The Future of Craftsmanship. By John Gloag. (Kegan Paul.) 2s. 6d. nett.

In this little volume on "The Future of Craftsmanship" Mr. Gloag's sub-title is an apt one. The book is one of the "To-day and To-morrow" series. In congratulating the author we are congratulating the publishers on a welcome addition to a list of about three dozen pamphlets with similarly interesting titles, such as Daedalus, Narcissus, Thrasymachus, &c. The description "pamphlets" is the publisher's own; but are they correct in their suggestion that it is "a revival of a form of literature which has been in disuse for 200 years"? Surely John Ruskin has not been dead so long as all that, and did he not append to his pamphlets such titles as "Deucalion," "Proserpina," "Ariadne Florentina," &c., &c.—not to mention that remarkable and long series of letters (or pamphlets) to working-men, "Fors Clavigera," whose title alone was anathema to many? But granted Ruskin's was not the age of the great pamphleteers, perhaps an Addison or a Steele may be reincarnated in our own day.

"Artifex" is a virile sermon on morality in the arts and crafts—where we were, where we are, and where we may be (or not be) in the great to-morrow. We do not commend the book to any reader, be he master or mechanician in craft-production, who may wish to avoid the unpleasantness of home truths. A book that can afford a few exciting hours to a, perhaps, jaded reviewer may well afford many reflective hours and a wholesome stimulus to any serious student of the arts and crafts. It would be easy enough to quote a dozen and, indeed, we have marked more than a dozen of the author's pregnant thoughts; but one or two will suffice. He tells us how in mediæval times "Craftsmanship under the care of the Church and Guilds marches from triumph to triumph. The buildings of the 12th, 13th, and 14th centuries remain to remind us of a time when there were so many able craftsmen and the knowledge of building and working wood, stone and metal, of carving and painting, was so widespread, so commonplace, that no great names stand out to be identified with this building or that. There was a great common art." And so he carries us through the advances, the checks and the retrogressions from the free expression of art through the people, by the people, and for the people down to the decadent days of machine-craft in the 19th century. The author is constructive in his theories and sufficiently optimistic to see light ahead. It is all a matter of education on sound lines and in right directions. "The education of craftsmen must be directed to make hand-craft and machine-craft compatible." . . . "Unless the great mass of people is taught how to think, and, consequently, how to criticise, technical education will be handicapped, for although it may improve craftsmanship, it cannot create the demand for well-made things that must sustain good craftsmanship." In short, the consumer as well as the producer must be educated, for unless the great mass of people is taught how to think there can be no healthy demand for "good workmanship in the commonplace things of everyday life."

Design and Construction of Formwork for Concrete Structures. By A. E. Wynn, B.Sc., A.M.Inst.C.E. London: Concrete Publications, Ltd. Price 20s. net.

We give elsewhere in this issue some useful notes on "Formwork for Beam and Girder Floors," extracted from this volume, the publication of which marks a definite step in modern construction in that for the first time it gives in one volume a complete treatise on the design and erection of shuttering for every type of construction. This is the only book printed in the English language dealing exhaustively with the subject, and it is fortunate that an engineer of such wide experience, both at home and abroad, of all kinds of constructional work should have written it.

The volume comprises 320 pages, and includes no less than 219 drawings and photographs of shuttering for different purposes. A feature of the book is the series of tables from which may be seen at a glance the sizes of timber necessary for different purposes. An idea of the simple manner in which this is set out will be gathered from Table 1, reproduced on this page, which shows the maximum span of floor sheathing for various thicknesses of slab, from which one may see at a glance the size of timber necessary for slabs of different thicknesses across varying spans.

This treatment is carried out in connection with wall forms for various heights of wall; column forms for columns from 6 ft. to 30 ft. in height; safe loads on posts from 4 ft. to 20 ft.; spacing of floor joists for various spans and thicknesses of slab; maximum concentrated loads carried by ledgers and wales for various spans and spacing of loads; spacing of column yokes for various sizes and heights of column; maximum spacing of wales and wall ties for various sizes of studs and heights of wall, &c.

The first chapter is devoted to a discussion of form building in general, after which the theory of formwork design is thoroughly dealt with in simple language. Chapter V gives designs for 19 purposes, including simple slabs for varying spans; beam and girder construction; flat slab construction; columns; walls; stairs, &c.; while the following chapters deal in detail with the design of shuttering for different purposes. In each case clearly drawn diagrams are given, together with photographs where they are necessary to illustrate the design.

A valuable feature of each design is data for costing, from which the cost of the shuttering for any purpose may be readily calculated.

The book may be thoroughly recommended to engineers and builders interested in reinforced concrete construction and the casing of steelwork, and should be particularly valuable to foremen engaged in the carrying out of such work. The designs and data included in the book rescue formwork from haphazard guesswork; from the information given the exact scantlings necessary for every purpose can be ascertained, with a consequent saving in material and the elimination of the risk of collapse through faulty design or erection.

The Arithmetic of Building. By Chas. G. Dobson. "Lockwood's Trade Manuals." (London: Crosby Lockwood & Son.)

This little work of about 90 pp. deals with the calculations which have to be made in a builders' office relating to the work done by the excavator, bricklayer, mason, carpenter, slater, tiler, &c., in ordinary building w The work involves no special difficulty; in f seldom goes beyond the "first four si rules" of arithmetic, but there are cer peculiarities of treatment that have grown the trade treatment of the subject that begin need to learn, and the author's little work do this. Duodecimal calculations are scar known outside the building trades, and difficult to explain why this method has retained so long. For instance, take example given on page 5, where the are required of a rectangle (?) 6 ft. 9 in. by 4 and this is given as :—

$6' 9'' \times 4$ in. $= 6' 9'' \times \frac{1}{3}' = 2' 3'$ su

By duodecimals the process would be—

6 ft. 9 in.
4

2 ft. 3 ft. 0 in.

and this result is the same as above.

By ordinary arithmetic one would pro thus :—

$$(6 \text{ ft. } 9 \text{ in.}) \times (4 \text{ in.}) = (6\tfrac{3}{4} \text{ ft.} \times \tfrac{1}{3} \text{ ft.})$$
$$= \frac{27}{4} \times \frac{1}{3} = \frac{9}{4} = 2\tfrac{1}{4} \text{ sq. ft.}$$

In the first method one is multiplying in by feet (!), whereas strictly it is impossibl mix different units together without obtai anomalies. One square (or super) foot cont obviously 144 square (or super) inches, yet result is given (accepted and understood 3 in. super, whereas it is 36 sq. inches!—a different matter. The author writes (fee inches gives "ins. sup." in area) and so exp this mix-up of units. There are many exce suggestions and explanations given by author, which will assist the student of "B ing calculations," but it is questionable if is any gain in departing from the usual met of arithmetic.

British Waterworks Year Book and Dire with Statistical Tables, 1926. Publishe the British Waterworks Associa General Editor, G. P. Warner T Secretary to the Association, 173, Rose avenue, London, E.C.1. First issue, £1 1s.

The British Waterworks Association issued a Waterworks Year Book and Dire with statistical tables, which contains a of information relating to waterworks u takings in Great Britain and a few o British waterworks beyond seas. The b in three parts—(I) directory, (II) stati tables, and (III) general information. directory part gives in alphabetical orde names of undertakings with particulars date of establishment, names of chief off special Acts and limits of supply, the s of supply and the character of the Domestic charges, charges for metered and supplies, and miscellaneous charges, inc bulk supplies, and public water rate, it are also given. The statistical tables f particulars (in Table I) as to sources of s extent of catchment area, storage or subs reservoirs, wells and springs, and engine The third table contains further details supply from all sources, whether by gravi pumping or otherwise, including bulk su The miscellaneous information contains l the Ministry of Health Advisory Commit Water Supplies, the Executive Committe the Standing Committee on Water Regu of the British Waterworks Associatio Council of the Institution of Water En and of the Water Companies Associatio Members of the Joint Industrial Coun the Waterworks Undertakings Industry the District Councils and a number o cellaneous societies concerned with terested in water supply. The compila so much information and its subsequent a ment represents a great deal of work, a B.W.A. and Mr. Warner Terry deser fullest praise for the lucid manner in they have carried out their task. The r a handbook which will be of incal assistance to water engineers, surveyo all connected with waterworks undertak

From "Design and Construction of Formwork for Concrete Structures," by Mr. A. E. Wynn. (*See page* 658.)

THE LONDON BUILDING ACTS AND THEIR APPLICATION.—XV

By H. V. MILNES EMERSON, A.R.I.B.A.

ESCAPE FROM FIRE (*continued*).

The following are the general requirements of the L.C.C. in regard to applications in respect of the means of escape in case of fire to be provided in accordance with the provisions of the Acts. These regulations, however, are not to be taken as binding upon the Council, but only as a general guide, as each case is considered and dealt with upon its merits.

Applications.

Applications for the Council's certificate in respect of the means of escape from new buildings and applications with proposals to meet the Council's requirements in respect of the means of escape from existing buildings, or for exemptions from any of the provisions of the Acts, should state:—

(*a*) The Act and section of the Act under which application is made.

(*b*) The number of persons for whom sleeping accommodation is provided and the number of persons occupying or employed on, or intended to be occupied or employed on, the various floors of the premises, specifying approximately the number of males and of females.

(*c*) The trade (if any) carried on, or to be carried on, on each floor, with particulars of machinery, &c.

(*d*) In the case of existing buildings, the date of erection of the building.

(*e*) The name and address of the owner and the occupier (if any).

(*f*) Particulars of the occupation or proposed occupation of the building. If in different occupations, particulars with regard to each part should be furnished.

Plans Required.

Applications should be accompanied by all necessary plans, sections and elevations, drawn to an $\frac{1}{8}$ in. or $\frac{1}{4}$ in. scale ($\frac{1}{8}$ in. scale preferred), and by a block plan to a small scale, showing the premises and the surrounding buildings and thoroughfares, such block plan to have the north point indicated. These plans should show (as far as may be necessary for the purpose of the application), the means of escape proposed to be provided.

Means of Escape.

At least one enclosed and protected staircase and exit is required, and in addition an alternative means of escape from each floor by one of the following means:—

(*a*) Another enclosed and protected staircase and exit in the same building.

(*b*) A suitable staircase in another block, to which access is given by door openings in the party or division walls, or by external communication.

(*c*) External gangways or balconies, affording access to adjoining or adjacent buildings.

(*d*) An external iron staircase.

(*e*) Any other suitable arrangement which will, in the opinion of the Council, secure the desired object, having regard to the circumstances of any particular case. No arrangement which is not permanently fixed in position, or which requires manipulation in part or in whole in order that it may be used in case of emergency, can be accepted.

Where two or more means of escape from any floor are provided, they should be placed as far as is reasonably practicable from each other so as to be approachable from any part of the floor area independently of any one fire risk on that floor.

(*f*) In all cases where considered necessary by the Council, some means of escape from the roof of the building to the roof of the adjoining premises should be provided.

(*g*) In small premises and in some cases where it is possible to provide a staircase in a central position, one enclosed staircase may be accepted provided the premises are not used for the storage or manufacture of inflammable or explosive materials.

Maintenance.—Means of escape to be kept in good repair, &c.

Details of Construction.

(1) Enclosed and Protected Staircases.

A.—Internal incombustible staircases:—

(*a*) The staircases including landings, lobbies, and passages from one flight to another, should be enclosed by walls, not less than 9 in. thick, the outer edge of the steps and landings being properly supported.

(*b*) The staircases should be ceiled with iron and concrete where they are not carried up above the roof or where they are carried up above the roof and are liable to attack by fire from an adjoining structure.

(*c*) The staircases, including the flooring in the lobbies, approach, passageways, &c., should be constructed of incombustible materials with solid square or spandril steps, which should be supported at both ends on brickwork. The steps and landings should not be less than 6 in. thick.

(*d*) Spandril steps, where used, should be of the following thickness:—

(i) For staircases 3 ft. 6 in. wide, not less than 3 in. thick in the smallest part.

(ii) For staircases 4 ft. 6 in. wide, not less than $4\frac{1}{2}$ in. thick in the smallest part.

B.—Internal fire-resisting staircases.

(*a*) The staircases, including the treads, strings, carriages, landings, joists and floors, should be constructed of oak, teak, jarrah, karri, or other hard timber of not less than $1\frac{3}{4}$ in. finished thickness (no fir or pine must be used), and the enclosure to the staircase should be a solid partition of incombustible or fire-resisting material at least 3 in. thick, carried up through the thickness of the floors.

(*b*) The ceilings and soffits of the staircases and landings, if any, should be of plaster or cement.

(*c*) A suitable balustrade should be provided where necessary to the outer strings of the staircases.

External Iron Staircases.

(*a*) Staircases, including the strings, bearers, and supports, should be of iron, and constructed throughout upon dead bearings, to the satisfaction of the District Surveyor.

(*b*) The steps and landings should be constructed of solid or perforated iron plates (if perforated plates be used no perforation should exceed $\frac{3}{4}$ in. across each way).

(*c*) The risers should be of iron, either solid or of a close pattern.

(*d*) Where an iron staircase is in general use, the treads and landings should be finished with a surface of approved non-slippery material as distinguished from perforated iron or chequered iron plates.

(*e*) All windows and similar openings by or near any such staircase should be glazed with fire-resisting glass, and where necessary the sashes and frames should be fixed.

(*f*) A balustrade of a close pattern at a suitable height should be provided on each side of the flights and around the landings. If balusters are used, they should be not more than 6 in. apart.

(*g*) The staircases should deliver into the outer air at the ground level, into a public way or thoroughfare, or some large open space.

Generally as to Staircases.

(*a*) Internal staircases should, where practicable, be placed next to an outer wall, and be so arranged that persons enter them from any floor level in the direction of the descent.

(*b*) Internal staircases should be properly lighted and ventilated by windows, or, in exceptional cases, by other effective means.

(*c*) The treads of the staircases should be not less than 10 in. wide, and clear of nosings, and the risers not more than $7\frac{1}{2}$ in. high.

(*d*) Staircases should be provided with handrails fixed on both sides thereof, and continued around the landings and chased into the end of newel walls where these occur.

(*e*) Where the doorways or staircases may be used as means of escape by not more than 200 persons, they should be not less than 3 ft. 6 in. wide.

(*f*) Where the doorways or staircases may be used as means of escape by more than 200 persons or by more than 100 persons on any one floor they should not be less than 4 ft. 6 in. wide.

(*g*) The doorways for access to, and exit from, the staircases should in all cases be of the width in the clear mentioned above when the doors are open.

(*h*) All doorways leading to staircases should, where necessary, be recessed. The recesses should be constructed throughout of fire-resisting materials, and be fitted with doors of fire-resisting materials (oak, teak, &c., not less than $1\frac{3}{4}$ in. finished thickness) in two folds hung so as to open in the direction of the exit or to swing both ways clear of the steps, landings, passageways and footways. Such doors must be fitted with springs, weights or other approved appliances to close them after use. The frames of the doors shall be bedded solid to the walls or partitions.

(*i*) Staircases should be arranged in straight flights without winders; each flight should consist of not more than 15 steps; landings should be provided at top and bottom of each flight; the steps and landings should be of the full width of the staircases.

(*j*) Landing space not less than 2 ft. 6 in. wide should be provided between the steps of the flights and the escape doorways leading to and from the staircases.

(*k*) All supports to internal fire-resisting staircases and their enclosures should be of fire-resisting materials, and all iron work supporting internal staircases and their enclosures should be protected by plastering or other incombustible or non-conducting external coating not less than 2 in. in thickness.

(*l*) Doors at the head of staircases affording access to the roof should be glazed in the upper panels with ordinary glass.

External Iron Gangways and Balconies.

(*a*) These gangways and balconies should be supported on dead bearings and be provided with solid floors of incombustible materials; if perforated iron flooring is used, perforations are not to exceed $\frac{3}{4}$ in.

(*b*) A suitable balustrade, not less than 3 ft. 6 in. high, should be provided to these gangways and balconies.

Enclosure and Position of Lifts.

In cases where a lift will in the opinion of the Council, endanger the means of escape, the following requirements should be observed:—

(*a*) Lifts, excepting passenger lifts in staircase wells, should not be placed near escape staircases.

(*b*) In buildings with fire-resisting floors, lifts should be enclosed with incombustible materials and fire-resisting doors. When the shaft of the lift is carried up to the roof it should be continued through the roof and, if covered, thin glass should be used, protected on the outside with strong wire guards.

(*c*) In other buildings where there are large floors undivided by partitions, fixtures, &c., lifts, if placed as far as practicable from the staircases, exits, &c., may be enclosed with fire-resisting materials to a height of 4 ft. above each floor level and above this with stout wire-mesh guard.

Buildings Used for the Storage of Inflammable Liquid.

(*a*) Rooms in which inflammable liquid is stored should be separated from other parts of the building by brick walls and fire-resisting floors and ceilings.

(*b*) Doorways for access to such rooms should be fitted with self-closing, fire-resisting or iron doors.

(*c*) Adequate ventilation should be provided.

(*d*) Living rooms, workshops or workrooms constructed over, or communicating directly with, any part of a building used for the storage of inflammable liquid, should be provided with exit doorways giving access to some safe position, as far as practicable from the storage, and with doors hung to open in the direction of exit with only such fastenings as can be easily and immediately opened from the inside.

ARCHITECTS' & BUILDERS' INQUIRY BUREAU

We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters.

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or, better still, in typewriting?—ED.

Rain-Excluding Device.

SIR,—Can you tell me of any patent device on the market to prevent rain from coming in through casement windows when closed?

J. M.

Penalty Clause.

[REPLY TO "SPEED-UP," APRIL 15.]

SIR,—Any order for extra work, given by an employer or his architect, impliedly extends the time for completion of the contract work; unless the contract specially stipulates that time is an essential factor and no extension is to be allowed for extra works.

Now, although an architect has no implied power to order extras or vary the work on his own authority, yet most contracts nowadays give him express power to do so; and in using this power he is strictly limited by the terms of the contract. Provided he acts within the scope of his authority in ordering variations involving extra work on a contract which is to be completed by a certain day, under a penalty for liquidated damages, and completion is necessarily delayed thereby, then the penalty for delay is not recoverable. [See Dodd *v.* Churton (1897), 1 Q.B. 562], and Creswell on Building Contracts.

LAW.

"Cement Stucco."

[REPLY TO "A. B. C.," MARCH 25]

SIR,—For at least two generations in the United States, stucco has been a term applied to all outdoor rough cast work on the walls of buildings. We have stucco made with Portland cement, that is known as "cement-stucco," as distinguished from lime stucco and stucco made with magnesia. Your correspondent states that in Aberdeen the word stucco is used exclusively for plaster-of-paris. This was, many years ago, the only stucco that was known, but custom has now decreed, in America at least, that all plastering work, except ornamental plastering, upon the exterior of houses is stucco.

ERNEST MCCULLOUGH,
Editor of the *Building Age and National Builder.*

New York.

Multi-coloured Rustic Slates.

[REPLY TO "NERVOUS," APRIL 8.]

SIR,—As a general rule, consignments of slates of the above description vary so much in thickness that it is inadvisable to lay to a pitch flatter than the minimum in ordinary flat tile construction. It is rarely possible to inspect the consignment before the design of the roof is settled, so that it is wise to legislate for a minimum pitch of 40 deg., although the slates may turn out to be suitable for a slightly flatter pitch than this. The question of the exposed, or otherwise, position of the site must also influence the pitch to which these slates may safely be used.

LAP.

Returning Bills of Quantities.

[REPLY TO "IRREGULAR," APRIL 8.]

SIR,—I quite agree that the procedure described by your correspondent is unusual, although its fairness and legality seem to me to be above question. If all competing firms are called upon to send in their priced schedules with their tenders a certain amount of additional burdensome clerical work is entailed, but two nuisances are checkmated, viz., the "sporting" competitor, who sends in a spot figure which he piously hopes to be able to reconcile at leisure to an economic schedule; and the "courtesy" competitor who, rather than risk offending by refusing to tender, rings up his fellow-tradesmen and takes care to beat their figure respectably, with no hard work entailed. The first class are the men who are more often than not let down by their own guess and seek to make good by scamped work and inconsistent extras, to the discredit of their trade, and the second give a false colour to what may appear to be close tendering. Your correspondent may certainly detach the tender form and retain his schedule, but I should imagine his tender would be disqualified and I really do not see what he will gain by the procedure.

ABOVE BOARD.

Dampcourse.

[REPLY TO "THOMAS," APRIL 15.]

SIR,—I have recently inspected a number of old properties in a granite district, and have been amazed at the amount of damp appearing through the absence of a dampcourse. It is obvious that practically the whole of the absorption is by way of the mortar joints, and I consider that this indicates that however perfect the concrete blocks may be in a house of the construction described by your correspondent, the risk of porous joints is too great to render the omission of a dampcourse even a fair risk. The cost is, after all, so little in proportion to the cost of a house, that it is really not worth while considering.

SAFETY FIRST.

Oak Sills.

[REPLY TO "QUESTION," APRIL 15.]

SIR,—I always specify oak sills, where the woodwork is stained only, but to be given a coat of varnish after staining. This is a necessary and adequate surface protection, and costing very little.

SUNBURN.

Penalty Clause.

[REPLY TO "SPEED-UP," APRIL 15.]

SIR,—A variation will affect the time limit only if it involves additional work over and above that considered when the time limit was assessed, or if it brings about difficulties which could not be foreseen by the contractor in tendering. Each case of this sort would have to be judged on its merits. As regards a penalty, I have myself known, since the war, a penalty enforced and admitted, and also a bonus paid, both cases being jobs in which variations had been made.

JUDGMENT.

THE WEEK IN PARLIAMENT

WESTMINSTER, *Wednesday.*

PARLIAMENT adjourned on Thursday, April 14, to Tuesday, April 26.

The Mercantile Marine Memorial.

A Select Committee of the House of Commons have considered the Bill which confers powers on the Imperial War Graves Commission to erect a memorial on Tower Hill to the officers and men of the Mercantile Marine who lost their lives in the war. Mr. Gosling presided over the Committee.

Mr. H. F. Bidder stated that the Memorial was designed by Sir Edwin Lutyens, and would be erected in a part of the gardens of Tower Hill. Those gardens had been held in trust since 1797, and there were various parties interested therein. The frontages and even the underground railway, whose tunnel ran under the gardens, were concerned, but all interests had been considered and general agreement obtained.

The Bill was ordered to be reported to the House, and has since been read the third time.

Duty on Translucent Pottery.

Mr. Churchill, the Chancellor of the Exchequer, in his Budget, stated that the Safeguarding of Industry procedure in the present year had evolved a duty of 28s. per cwt. for five years on table ware of translucent and vitrified pottery. He made that proposal in accordance with the recommendation of the Majority Report of a committee duly appointed. The duty would become chargeable on April 19, and it was estimated to bring in revenue to the extent of £150,000 this year, rising to £200,000 in full year. That yield, although modest, ought not to be disdained, having regard to the financ situation.

Price of Houses.

Mr. Chamberlain informed Mr. Short th the average prices of houses in contracts let local authorities, excluding the cost of la and development were, in May, 1926, £436 respect of non-parlour houses, and £495 parlour houses; the corresponding figures January, 1927, were £427 and £492.

The Royal Chapel at Windsor.

Lieut.-Commander Kenworthy asked the Fi Commissioner of Works if he would state wh was responsible for the heraldic advice giv when the Royal Chapel at Windsor was restore if he was aware that the yale which figured the heraldic decorations was now represent with both its horns sloping the same wa whereas the ancient design was for one ho to point forward and one horn to point bac wards; and whether, in the interests heraldic accuracy, he would take furth advice with a view to the necessary alteratio being made.

Captain King, who replied, said that th Chapel was under the jurisdiction of the Dea of Windsor, and the First Commissioner wa therefore, unable to take any action in th matter.

ENGLISH COUNTRYSIDE*

"THE soul of England must not be sought the city, but in the countryside; the city is t working-place of the few, the many yearn for cottage and a plot of ground where the wi blows pure and the heavens are not masked a pall of gloom." Mr. Pulbrook is not the fi writer who has propounded this thesis; a possibly hundreds have said it more grandil quently, if not more forcibly. William Mor said many significant things about the lure the beloved Homeland, and our author quot him: "This is a little land, sirs, too much sh up within the narrow seas, as it seems, to ha much space for swelling and hugeness; the are no great wastes overwhelming in their drea ness, no great solitudes of forests, no terril untrodden mountain walls; all is measure mingled, varied, . . . it is neither prison n palace, but a decent home." And surely th sums up the reasons that the exile will halting give for his intense longing, aye, and workin for an ultimate return to that Homeland whi has "as many facets as a well-cut diamond . flashing all the colours of the rainbow in ma ways and at many angles, so that it is impossit to say which effect is most beautiful."

Are we all, each and severally, doing our b little or big, to keep this priceless herita unsullied? A few weeks ago our conscienc were stirred at the suggestion that Borrowdal road was to be made practicable for the supe motorist; and we may ask: Is a tar-m motor track a fair exchange for a glacier-wo moraine of a remote geological age? T author has much to say about "By-roads a Trackways" (Chapter XI), from prehisto cattle-ways to Roman roads and pilgrim-wa of mediæval times; and he appears to know about road lore. In looking at illustrati number 77, "A Byway in the Quantocks Triscombe," we try to imagine it brought up-t date for the motorist!

The green-covered book, with its 136 pages legible type and 126 delightful illustratio deals with the Homeland from Cumberland Cornwall and from Lincolnshire and the Norfo Broads to the Welsh Marches, its country stil wayside and market crosses, its meres, runni waters, ancient fords and bridges, water-mil windmills, cottages, barns, country inns, shepherds and their flocks. The author remin us of the intimate scenes which gripped us our youth—and youth has no age—in such fashion that they remain with us as precio memories whilst we forget the novels and pla we read and saw last year. If we have said t little about the book it is because it is so co pelling in suggestion.

THE BUILDING TRADE

UNEMPLOYMENT INSURANCE.—I

The Report of the Committee appointed ider the chairmanship of Lord Blanesburgh to consider, in the light of experience gained the working of the Unemployment Scheme, hat changes in the Scheme, if any, ought to made" is an extremely important docuent, and the recommendations of the Comittee acquire increased weight from the fact at the Committee were unanimous in their ndings.

From a sentence in the Introduction to the eport it is at once made apparent that the ommittee were alive to the difficulties inlved: "From whatever standpoint it be rearded, the whole subject bristles with diffilties and demands careful consideration. It ises problems which affect in greater or less gree the morale of the community as a hole, as well as the well-being, peace of ind and self-respect of many millions of orkers."

From the Historical Review contained in the eport it is interesting to see that the genesis unemployment insurance is to be found the action of the Friendly Societies and rade Unions. In 1905 the former Societies, hich had adopted a scheme, represented ,000 members; but in 1904 Trade Unions, ith a membership of 950,000, were paying nemployment insurance, and although in me cases it was but represented by travelling lowances to members seeking work at a stance, in other cases the benefit was subantial, varying from £1 to 10s.

During the years 1896-1905 these eighty-one rade Unions had paid sums amounting to early £3,750,000, and it is interesting to d that the Trade Unions adopted a principle hich was closely followed in the first Unployment Insurance Act, 1911, viz., a aximum number of weeks for which benefit ght be allowed either continuously or within given year, and the imposition of a "waiting riod" before it commenced, during which e unemployed was expected to live on his n resources. These schemes also allowed thing for the dependants of married workers. d in this respect also the Act followed it.

The Report contains the following observaons upon the first Act of 1911: "The benefit as not based on need but on contract, and was too small in amount to offer any incement to idleness. The Act of 1911 in this oided pitfalls of a more generous scheme, t it would have been quite unequal to the ution of the unemployment problem in its ore recent developments. Its degree of equacy, however, when unemployment was v is remarkable."

The war period disturbs statistics; in the st place, unemployment was negligible, and " Out-of-Work Donation" covered much the ground that the Act, as enlarged by at of 1916, covered.

The Act of 1919 increased the benefits, but until the end of 1920 the fund s more than solvent, showing a favourle balance of £21,200,000; but then employment began rapidly to increase. We ust quote one passage here from the port, as it agrees with the opinion we pressed many years ago in these columns, at unexampled unemployment, a direct result the war, should have been dealt with by cial means and not have been dealt with der the Acts which were based on an uarial basis: "The existence of this ance, the result of very low rates of conbution, probably had a great deal to do h the course of the later developments of mployed insurance in this country. It is improbable that, but for this balance, the st increase in unemployment which comnced soon afterwards would have been dealt h as an abnormal phenomenon, and in some er way than by extensions amounting almost to a transformation of the original scheme of insurance."

We cannot linger over this very interesting historical portion of the Report, but it is interesting to note that when the benefits were increased by the Act of 1920, the actuarial percentage of unemployment was placed lower than what the actuary in 1911 has assumed to be the percentage, 8.6; but the economic position deteriorated so rapidly that in 1921 it was 14 per cent. in the insured industries. Dependants received benefit first under one of the Acts passed in 1921.

The Report then traces the history of the extended benefit known as "uncovenanted benefit," which undoubtedly accounted for the deficit of £15,300,000 at the end of the insurance year 1922-23, which, although it had fallen to £7,100,000 by May, 1926, as a result of the General Strike and Coal Dispute, in December last amounted to £21,600,000. We can conclude this brief notice of the historical part of the Report with the observation of the Committee in connection with schemes now prevalent in Europe: "In point of fact we believe there is no Scheme in existence comparable with the British Scheme."

Alleged Abuses.

The Committee paid special attention to the alleged abuses which had been made of the system, and their finding on this was: "It is true that a certain number of the 11,750,000 of insured persons have received relief to which they had no claim. But it is equally true that these cases are relatively few, and that result, we believe, is due to the vigilance with which the Ministry, while dealing fairly with the genuine claimant, guards against abuse."

In 1925 fraud was suspected in 11,413 cases, prosecutions followed in 1,964, convictions were obtained in 1,844, and in 468 terms of imprisonment were imposed.

The Principles of Unemployed Insurance.

The Committee commence this section of their Report with the very pertinent observation that it would be unfortunate if preoccupation with the task of ascertaining how best unemployment can be insured against were to weaken any concerted effort to get rid of unemployment itself, and it pays a tribute to the Employment Exchanges and the Employers' and Workers' Associations.

The Report points out that specialisation is the root cause of much unemployment, and in paragraph 47 will be found some detailed suggestions as to how unemployment might be diminished, which we cannot set out here, as the Committee considered them outside the terms of their reference, and they only express the views of some of the members, but we may note one or two paragraphs. For instance, some of the members were impressed with the success achieved by the specialised Employment Exchange at Tavistock-street for those engaged in the building trade, and considered similar Exchanges should be set up for other trades; whilst others advocated a system of training for the unemployed for other occupations on the lines of the experimental work in connection with the training of women for domestic service.

It appears from the Report that there was agreement amongst all the witnesses, and in the evidence collected, that an unemployment scheme must now be regarded as a permanent feature in the code of social legislation, a view endorsed by the Committee; it was also agreed that the scheme must be compulsory and that it should at least cover all the occupations at present included in it; but there was a sharp cleavage of opinion among the witnesses as to whether it should be contributory in the present sense like the Health Insurance and the Old Age and Widows' and Orphans' Pensions scheme. The Trade Union Congress contended that "Industry should be relieved of the burden of Unemployment Insurance, and that both on economic grounds and grounds of equity the charge involved in the maintenance of the unemployed should fall upon the general body of taxpayers." The National Confederation of Employers' Organisations contended that "the contributory principle is an essential feature of any scheme worthy of support." The Committee considered that this formulation of a non-contributory scheme would be outside the terms of reference, as the contributory principle is the essence of the existing system, and if they had been so attracted by a non-contributory scheme their only course would have been to have advocated the abandonment of the present scheme altogether, and not, as within the terms of reference, to consider changes within that scheme.

The Report states that the Trade Union Congress representatives, however, frankly expressed an admission that in existing circumstances a non-contributory scheme could not be secured, and assisted the Committee in considering how the present scheme could be improved.

The Committee point out that the two schools of thought are not limited to those who advocate a contributory scheme and those who do not, for there is besides a further fundamental line of cleavage amongst the supporters of the non-contributory principle; one school would have a scheme universal and non-contributory, but subject to conditions of benefit more stringent than those which can fairly be prescribed under a contributory scheme; but the other school would relax existing conditions of benefit and throw the duty of finding employment primarily upon the State. This latter scheme appears to have been entirely ruled out by the Committee as being contrary to the principle upon which unemployment insurance is founded and to amount to an out-of-work donation. But even if the principle of contribution is admitted, as the Report points out, there is a wide divergence of opinion on the administration of the scheme as to benefit. As to this, see the observations of the Committee at page 30 of the Report. We cannot enter into this question in detail, but can only give the principles laid down by the Committee for a contributory scheme; but before doing so we should like to make one observation on the value of contributory schemes. In an earlier part of the Report (page 12) it is stated in connection with the original institution of unemployment insurance by the Friendly Societies that "the experience of Friendly Societies showed that the vigilance of contributors was an effective check upon the malpractices of dishonest applicants for benefit." That is an important argument against non-contributory schemes, and the Trade Unions, in administering their sickness funds, we feel certain would admit this; the interest of contributors is a safeguard against the exploitation of public funds, in which no one receiving benefit has any interest and which becomes regarded as fair game for all.

(To be continued.)

Bricklaying Record.

William Mignes, of Wiskersley, near Rotherham, a foreman bricklayer, employed by a Sheffield firm, has established a world record it is stated by laying 1,121 bricks in an hour. The previous record was 879 laid by John Wood, of Scarborough. The bricks used by Mignes were old, and were a pound heavier and a quarter of an inch thicker than the ordinary new brick. He kept six labourers working at top speed.

FORMWORK FOR BEAM & GIRDER FLOORS

The following notes are from Mr. A. E. Wynn's book on "Design and Construction of Formwork for Concrete Structures," which is reviewed on p. 654 of this number:—

In beam and girder floor construction the unit method is always used—that is, the slab panels, and the beam and girder sides and bottoms are built up in advance to the correct size ready for erection, and often beam and girder boxes are built up complete. Timber sizes for the different parts will be practically the same for all jobs, except that the joist size may vary somewhat with the span. Before deciding on the joist to use, comparison for economy in material should be made between two or three different sizes. The standard sizes used for all ordinary buildings are as follows:—

For slab panels, 1in. by 6in. dressed to ⅞in. by 5½in., tongued and grooved.
For joists, 2in. by 6in., dressed or rough.
For beam ledgers, 1in. or 1½in. by 4in. or 6in. dressed to ⅞in. or 1¼in.
For cleats or battens, 1in., 1½in., or 2in. by 4in. dressed.
For beam and girder bottoms, 2in. plank dressed four sides.
For beam and girder sides, 1in. by 6in. dressed if only used once, and 1½in. by 6in. dressed if used more than once.
For posts 3in. or 4in. by 4in., dressed or rough.

In choosing between dressed and rough timber, faces coming in contact with the concrete should always be dressed, and it is customary to order material for slab sheathing, joists, beam sides and bottoms, to be dressed four sides. Beam bottoms may be dressed on one side only if thereby a single plank, or two planks together, will give just the required width of beam. Joists can be rough, but are harder to handle, and the ends will have to be sized to an even depth. Posts are generally rough, and are stronger than when dressed; but if they can be used elsewhere, as for studs, they should be dressed. If there is a basement wall to build, the timber can be used again in the floors, and should be ordered with that in mind; that is, it may be cheaper to use 3in. by 4in. or 2in. by 6in. studs in the wall and re-use them as posts or joists in the floor rather than order 2in. by 4in. studs and have no use for them afterwards.

The average size of a slab panel between beams and girders will be about 5ft. by 18ft. This can be built in one, two, or four sections, the size depending mainly on the facilities for handling from floor to floor. With a hoisting engine on the job one panel would be the most economical, but if they are to be handled by hand two or four panels per bay would be better. The panel will rest on the top of the beam and girder sides, and should be ½in. to 1in. less in width and length than the clear dimensions between the concrete. They will thus set only partly on the sides, allowing ¼in. to ½in. in clearance all around for "give" in the top of the sides—they will always give slightly under the pressure of the concrete—and so prevent the panel binding in the concrete, and hence being difficult or impossible to strip. The edges all around should be bevelled to 45 degrees.

The boards are nailed together with 1in. by 4in. battens, spaced the same distance apart as the joists will be, and so that they will be about midway between joists. The battens must be about 2in. shorter than the width of the panel. As panels are liable to swell if left long exposed to rain, to prevent buckling an end board is often left off until the last minute; or if two panels are placed side by side a narrow strip is left between them, afterwards filled in or covered with a strip of tin or heavy paper.

Another method of construction is to nail the boards direct to the joists, using them as battens. This will save material and labour, but it makes the panels heavier to handle, so should only be used when there is sufficient equipment to handle them. Each end board is nailed on lightly for easy stripping, since if they stick they will remain in place while the rest of the panel can be removed. Sometimes the length of the panel is made board-width, short each end, and these boards nailed on lightly to a joist placed a board-width away from the girder, for the same purpose of easy stripping. One of the end boards is left off until last to allow for swelling and to provide an opening for cleaning out the forms. If the panels are to be used only once, unless it is desired to make them up in advance, loose boards can be used without battens.

The length of the joists will be the clear distance between beams less twice the beam side thickness less ¼in. The ends should be bevelled inwards at the bottom about ¼in., so that they can be easily stripped without binding. If rough joists are used the ends must be sized to an even depth to give a level slab. When they are nailed direct to the sheathing the length and bevel will be the same. The width of the plank for the beam and girder bottoms should preferably be the same as that of the beam so that cleats will be unnecessary; but, as the cost increases with the width, above about 10in. wide it is cheaper to use two planks nailed together with 1in. by 4in. cleats on the underside, 24in. to 30in. apart. The cleats must not be longer than the width of the bottom.

The length of the bottom will depend on whether it is to be carried on the column sheathing or blocked up from the yokes and butted against the sheathing. In the former case the length will be the clear span between the columns less ¼in. to ½in. clearance at each end, and the ends will be bevelled inwards at the top. In the latter case the ends will be square, and the length will be the clear span between columns less twice the column sheathing thickness. In the first case a little leeway in measurement is allowed, but in the latter measurement of the bottom must be accurate. The former method is generally used when the bottoms are to remain in place after the sides are stripped, and the latter when the sides and bottom are stripped together as a unit, as it gives a little more clearance after the columns are stripped. When the bottom is carried on the sheathing the column is a little easier to strip. When the beam bottoms are carried on the girders either construction may be used, and the length will be accordingly, the girder taking the place of the column.

The depth of the side girder will be measured from the under side of the slab sheathing to the bottom of the girder bottom. The side is usually made exactly this depth, but to save ripping a board, all full-width boards may be used and the side allowed to project below the bottom, in which case notches will have to be cut at the posts to allow the bottom to bear on the caps. The sides should never bear on the bottom, but always overlap. The length of the side will depend on the system of framing used. The best method is to make the length of the side equal to the clear span between columns less twice the thickness of the column sheathing less about 1½in. each end for clearance; that is, if the columns are 18in. square and 18ft. on centre, and the sheathing used is 1½in., the girder side will be 16ft. 0½in. long. The ends are bevelled outwards, and the 1½in. clearance is afterwards filled in with a bevelled batten, as mentioned later.

Another method is to make the length equal to the clear span less twice the sheathing thickness, or the ends of the sides will be flush with the column sheathing, and are covered with an independent bevel strip. Still another method is to carry the sides over the column sheathing, but stopping ¼in. to ½in. from the inside face and bevelling the ends inwards; in this case the length will be the clear span less ½in. to 1in. The latter two methods make the column sides less easy to strip and leave small fins on the concrete at the junction of side and bottom bevels unless the space is filled in. The first method will considered best practice, and the slightly ex labour cost will be more than saved when comes to stripping. The boards are nailed gether with battens 24in. to 30in. on cent the size depending on the depth, using 1in. 4in. battens up to 15in.; 1½in. by 4 in., fr 15in. to 24in.; 2in. by 4in., from 24in. 36in.; and 3in. by 4in. for greater dept The boards should be well clamped toget before nailing, to close up the joints. The e battens should be a few inches in from t ends.

The openings for the beams correspond the openings in column heads for the girde The width will be ½in. to 1in. wider than t width of the beam; the depth will be ½in. ½in. greater than the depth of the beam; a all edges will be bevelled inwards. If t beam bottom is carried on the sheathing, must be done anyway if there is not mu difference in depth between the beam a girder, the opening must be the depth of t beam plus beam bottom, and the bottom ed will be left square; and the width of the op ing will be that of the beam plus twice t beam side thickness. To support the bott a short piece of 2in. by 2in. or 4in. is nai under the opening in either case. Tempor cleats should be nailed across the openi until the sides are erected and braced.

If the beams are deep the openings w leave the girder sides weak, and they will liable to break when stripping. A g method of overcoming this is to build the s up to the underside of the beam bottoms a unit with the girder bottom, nailing them p manently together and stripping togeth The remaining portion of the sides is t built as separate units from column to bea and beam to beam, leaving 1½in. clearance each end if desired, and letting the batt project below the sheathing for lap. They built the same way as girder sides, prefera leaving 1½in. clearance each end as mention The connection to the girder is the same the connection of the girder to the colu They are nailed to the side battens at a d tance down equal to the depth of the joi They should stop off a few inches from ends of the sides. The top surface must level so that the joists will not have to wedged up or cut down to give a level fl For spans up to 6ft., 1in. by 4in. will be s ficient; for greater spans 1½in. material sho be used. Instead of a continuous ledger, 6 by 6in. blocks by 1½in. thick are often na on the beam sides at the spacing of the joi This will save some material, as waste can used and the joists will be easier to strip.

To the top of the post is spiked a cap of same size as the post and about 15in. to 1 longer than the width of the beam. The e of the cap are diagonally braced back to post by short pieces of 1in. by 4in. or 6in. opposite sides. The posts should be carefu cut off square at each end to obtain full b ing. The posts will rest on wedges, wh should be hardwood, 8in. to 10in. long, to 6in. wide, and tapering from 3in. down about ¼in. The wedges are generally pla on a 2in. by 8in. sill about 12in. long. bearing on soft ground, the size of the should be calculated to give a low pressure the soil, not exceeding 1 ton per square f The required length of post should be ne before ordering, as this is a place where th can be much waste. Spliced posts should e avoided; but they are sometimes necessa especially when a story height changes. T should have long cleats at the joint on all sides, well nailed, and the abutting ends the posts should be square. The posts f longer than 8ft., will have to be braced at e centre with 1in. by 6in. boards in both di tions, placed horizontally.

The diagram on p. 659 shows the assem forms, and methods of building the units making the connections. The different p being ready to erect, the carpenters sh work in three gangs, one placing bott another sides, and the last one joists and panels. The outside wall columns are first and plumbed, and on these are placed

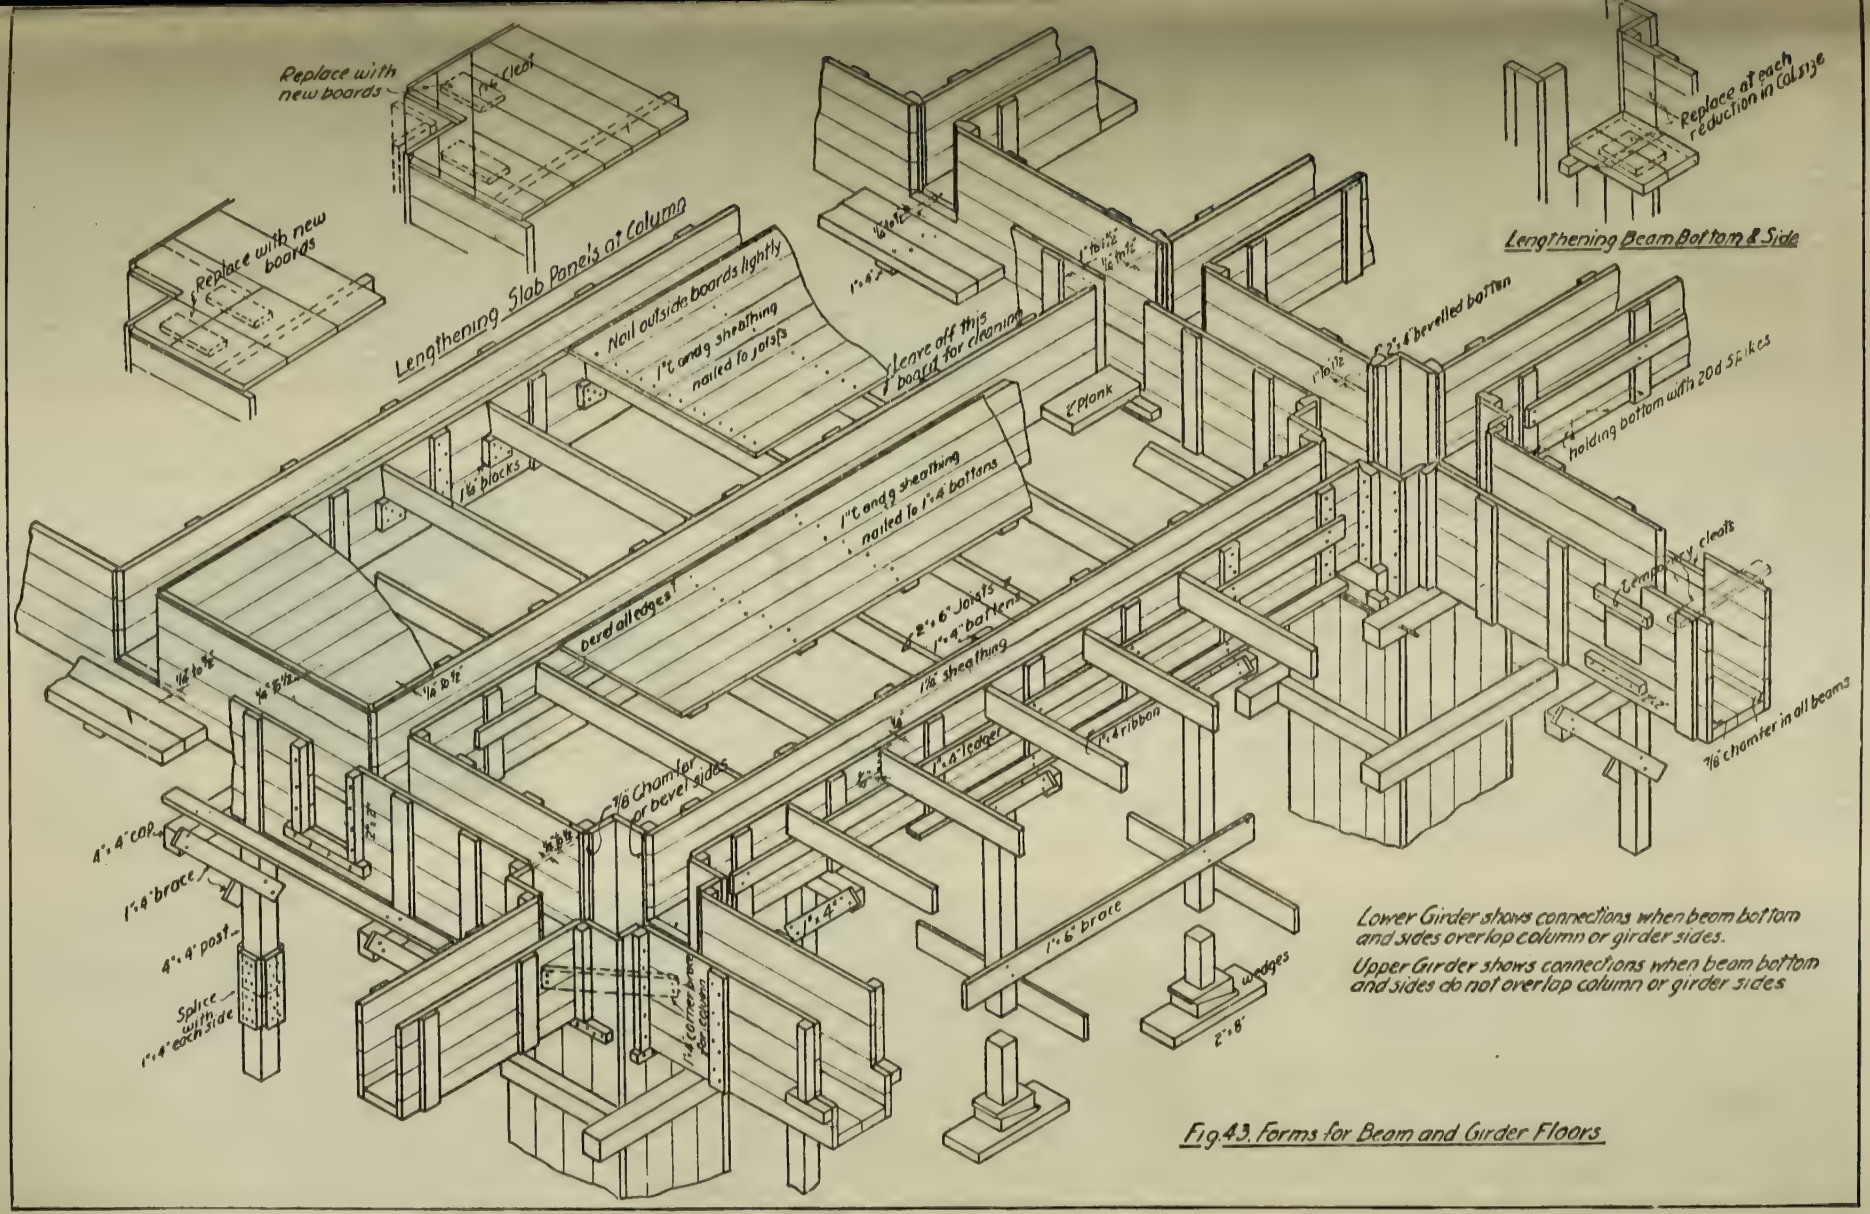

Fig. 43. Forms for Beam and Girder Floors.

Forms for Beam and Girder Floors.

From "Design and Construction of Formwork for Concrete Structures," by Mr. A. E. Wynn. (*See page* 658.)

beam bottoms all around the building, two corner columns being set first to give the line. This establishes definite points to work from, and the carpenters work in towards the centre of the building, setting next the first interior row of columns and placing the girder bottoms from these to the outside columns, then taking the next row, and so on.

One 20d. spike is placed in each end of the bottom and not driven home until the spacing of the columns has been checked with the tape. A shore is put under the centre, and a carpenter walks along the plank and drives a spike into it through the bottom, and then the remaining shores are placed and spiked. The sills and wedges are inserted under the posts —they should not be placed at the top—and the wedges are driven tight so that the bottom has a camber at the centre of about ¼in. in 10ft.; this is particularly necessary when shoring from the ground, as there will always be some settlement. If the girder bottom is not carried on the column sheathing, the top yoke should be placed at the right height to carry the bottom, and the beam bottom is blocked up from this yoke.

The girder sides are lifted into place and lightly nailed to the bottom to hold them in place, and braced across the top to prevent spreading. The beam bottoms between girders are next placed and shored up. It is important that all shores are placed plumb to avoid eccentric loading, and hence bending in the shore; this is particularly true of spliced shores. The beam sides are then placed, lightly nailed, and braced at the top: they should be set level. If 1½in. clearance has been left, 2in. by 4in. battens bevelled on one side are now inserted and nailed to the column or girder. They are put on now instead of when making the sides so that the bevel can be cut to suit the exact opening. The centre of the girder sides should be braced back to the beam sides.

If the joists are not nailed to the floor panels they are now laid on the ledgers at the required spacing, leaving them loose. When they are levelled up the floor panels are dropped into place; these are also not nailed down, except for one or two nails at the corners to hold them in place. The panels must be notched out and round the columns; this is more easily done in place than before. The lower edges of the beams and girders are usually covered with a ¾in. chamfer strip nailed to the bottoms.

The bottom of the sides must be held against the pressure of the concrete, and this is done in various ways. Beams up to 24in. total depth can be held by driving in a 20d. spike at each batten, and two intermediate ones driven into the bottom on the slant and in opposite directions, leaving the heads projecting for easy stripping. Without spiking the sides at all, the best method is to nail a 1in. by 4in. or 6in. ribbon on top of the shores on each side of the beam, and this will hold in any ordinary beam. Sometimes the side battens are carried below the beam and tied across with short pieces of 2in. by 4in. below the bottom. Bolts above or below the bottom are also used, particularly when heavy battens are required; and it may be necessary to use a bolt or wires half-way up the beam if it is very deep, as then the side becomes similar to a wall form, even perhaps requiring horizontal wales.

The last operation is to cross-brace the shores. Before commencing to pour, the wedges should be gone over and tightened up where necessary, and it is advisable to have a carpenter under the floor watching the forms, particularly the posts and wedges, all the time during concreting. Instead of erecting beams sides and bottoms separately, the beam boxes can be built as a unit; that is, sides and bottoms are nailed on the ground and erected and stripped together. One end of the box is up-ended to its position on the column, and the carpenters take the other end on their shoulders, and with the aid of a post raise it up on to the top yoke of the other column. There will be more weight to handle, though fewer pieces, and the fitting can be done more accurately. The sides are spiked to the bottom as explained before, and ribbons are not used unless the beam is over 24in. deep. The sides and bottom need not necessarily be stripped together, though they should be to use this method to the best advantage. It is generally economical for a one-story building, since the beams are light and the forms can be left in until they can all be stripped at the same time. In a multiple-story building, however, speed will generally require the sides to be stripped before the bottom, so they must be independent units and half the advantage of this method is lost.

Nailing the joists to the floor panels should be done where it is possible to handle the panels, because there will only be one unit to place instead of several. Isolated beams with no slabs must be held at the top as well as at the bottom, either by wood ties, bolts, or wires. It will be noticed that few nails are required during the erection; where they have to be withdrawn double-headed nails are an advantage. All these details are shown in the diagram on page 659.

Forthcoming Canadian Construction.

Construction contracts awarded in all the cities, towns, villages and rural districts throughout Canada during February, according to figures compiled by MacLean Building Reports, Ltd., totalled 19,516,700 dollars (£3,903,000), compared with 16,771,800 dollars (£3,354,000) in January and 13,477,600 dollars (£2,695,000) in February, 1926. The total for the first two months of 1927, 36,288,500 dollars (£7,257,000), is an increase of 38.8 per cent. over the awards for the same period of 1926. This large increase so early in the year is attributable not only to the very favourable winter building season in some portions of the country, but also to the better tone for general business throughout the year. Contemplated new work, for which plans are being prepared has been reported in exceptionally large volume since the beginning of the year, the total for the year to date being 159,314,000 dollars (£31,862,000). This is more than double the total for the first two months of 1926, and is indicative of a construction year well above the average.

The National Federation President.
From a Caricature by Mr. A. J. Geary.

NEW BUILDINGS IN LONDON

Bury-street.—Premises.—Messrs. Thomas Edge, of Woolwich, are the builders for n premises now being erected on a site in Bur street, Bloomsbury, W.C.1. The work is for t Co-operative Permanent Building Society, a the plans have been prepared by the Society own architects.

Carshalton.—Extensions.—The Metropolit Asylums Board recommend that, in the event the necessary sanction being forthcoming to t proposed extension of Queen Mary's Hospit for Children, at Carshalton, an architect appointed to prepare the plans and supervi the carrying out of the work.

Croydon. — Enlargement. — Enlargement including the addition of a balcony, are to made at the Palladium Cinema, North En Croydon. The architect is Mr. Bertie Crewe, 7 Shaftesbury-avenue, W.1.

Croydon.—Houses.—The Southern Fou dries, Ltd., are to erect 23 houses and 24 fla in a new street, north of Stafford-road.

Croydon.—Housing.—Messrs. G. & C. Parris have purchased land in Stafford-roa Croydon. This land is for housing purpos only.

Croydon.—Accommodation.—The Croyd County Borough Council has instructed t Borough Engineer to prepare plans and es mates for additional slipper baths at the Centr Baths.

Denmark-hill.—College.—Plans have be prepared by Mr. A. Gordon, L.R.I.B.A., Queen Victoria-street, E.C.4, and Mr. G. J. Viner, L.R.I.B.A., 23, Knightrider-street, E. in collaboration with Sir Giles Gilbert Sco R.A., for a college on a site on Denmark-h S.E., as a memorial to General Booth for t Salvation Army.

Balham.—Alterations.—Messrs. W. Champion & Son, of Peckham Rye, S.E., are t general contractors for the structural alteratio and additions to 137–139, High-road, Balha Messrs. Young & Co., of 6, Queen Anne's-ga Westminster, are supplying the steelwork.

Harrow-road.—Rebuilding.—A scheme is hand for the rebuilding of the Prince of Wa Cinema, Harrow-road. The new building v afford seating accommodation for about 2,3 people. The cost is estimated at £100,000. J. Stanley Beard, 101, Baker-street, W.1, is architect.

Holborn. — Extensions. — Barclay's Ba Ltd., are extending their premises in Holbo E.C., and Messrs. J. Smith & Sons, builders. South Norwood, S.E., are carrying out the wo

Lea Bridge-road.—Redecorating.—The M House Cinema, Lea Bridge-road, Leyton, is be redecorated for Mr. H. Pearl, of the Biogr Theatre, Wilton-road, S.W.1.

Mitcham-road.—Baths.—The Croydon Co cil have for some time had under considerat the provision of slipper baths and washho at Mitcham-road, and they have now direc the Borough Engineer to submit sketch pl and estimates for the works.

Victoria.—Cinema.—On the site runn through from Vauxhall Bridge-road to Wilt road a new cinema is now being erected. cost is estimated at about £90,000. The ar tect is Mr. E. A. Stone, 20, Berkeley-street, W

University College of Hull.

The organising board of the University lege of Hull have recently approved sketch plans of the initial buildings wh make provision for all likely needs for some years. In the first stage, one complete q rangular block on the eastern frontage wil erected to accommodate the departments physics, chemistry, zoology, and geogra a temporary library and a temporary asser hall and common rooms, a refectory, and o buildings needed by the staff and stude On the western part of the frontage to Cott ham-road three wings of a quadrangular buil will be erected to accommodate administra and a faculty of arts, as well as the depart of botany. It is expected that the wor drawings will be ready in a few weeks.

NATIONAL JOINT COUNCIL FOR THE BUILDING INDUSTRY

The annual meeting of the National Joint uncil for the Building Industry was held at M.C.A. Building, Tottenham Court-road, ndon, W.1, on Thursday, March 24, Mr. E. Collier being in the chair.

We take the following extracts from a copy the official report which we have received :—

The report of the deputation appointed to nfer with the Scottish Regional Joint Com-ttee respecting the position created by the pressed intention of the Scottish Building ntractors' Association to reduce the rate of ges payable to labourers had been circulated, d the Vice-Chairman reported that subsequent the visit of the deputation to Edinburgh, Scottish Building Contractors' Association deavoured to enforce the proposed reduction the labourers' rate. This action was resisted the operatives withdrawing labour. Follow-prolonged negotiation it had now been eed that work shall be resumed on the *status* , the Industrial Court being asked to give opinion upon the following question :—

Should the National Agreement apply to the lding trade labourers affiliated to the National deration of Building Trades Operatives who employed by members of the Scottish ilding Contractors' Association in Glasgow d the West of Scotland ?

The position is that the members of the ttish Building Contractors' Association are paying the prescribed rate to labourers and half-penny increase to bricklayers.

On motion made and seconded the report of deputation was received and adopted, and General Purposes Committee was authorised arrange for the representation of the Council, required, at the hearing by the Industrial urt.

In the absence of the chairman of the Com-ssion (Mr. F. G. Hodges), Mr. Forsdike sented the report of the Grading Commission, d the adoption of the section dealing with the plication from the North Western Region for exceptional rate for No. 1 Area, was moved d carried.

The South Wales Region section of the ort was adopted, as well as the section of the ort relating to the Midland Region. A her point emphasised in the discussion was need for Regional Joint Committees to aust the possibilities of negotiation now n to them before referring matters to this ncil for decision. After serious considera-n the Commission agreed to refer back to the gional Joint Committee the whole position pecting the painters in the South Western gion. A communication was reported from secretaries, North Western R.J.C., stating t that R.J.C. had agreed to recommend hat the North Western No. 9 Area be re-ded from B1 to B on and from May 1, 1927, to A3 on and from July 1, 1927," and ing that this recommendation be submitted the Council for approval. The North stern No. 9 Area comprises Abergele, Bagillt, twys-y-Coed, Colwyn Bay, Conway, Denbigh, ywell, Llandudno, Mostyn, Prestatyn, hin, Rhyl, and St. Asaph. It was moved seconded that this recommendation be roved. Mr. Barron presented the report of General Purposes Committee and first moved adoption of the section dealing with the rences from the Eastern Counties Region, ch was carried. The section of the report ing with references from the South Western ion on points of order was next agreed.

he recommendations respecting the pro-d variations for application to the Bristol trict were then proposed, seconded, and ed. The adoption of the section of the ort dealing with the London Region was ied. The report in respect of the claim for ers' tool allowance set out that evidence for against the claim had been heard, which the mittee proposed to examine fully at the first opportunity and duly report the result. This report was received.

This concluded the consideration of the report of the General Purposes Committee, and the chairman observed that by the adoption of certain of the recommendations of the Committee the Council had given decisions of some importance, especially in this initial stage of dealing with regional proposals, as the decisions to contain principles for the guidance of members of the Council and of those who have to deal with notices in their own Regions. He suggested that these decisions should be tabulated in such a manner as to be readily accessible :—

Q.—Is it permissible, by means of a "Variation Amendment," to extend the schedule appended to National Working Rule 3 by adding thereto other classes of work ?

A.—Proposals to add other classes of work to the Schedule of Working Rule 3 may properly be considered by Regional Joint Committees as "Variation Amendments."

Q.—Are the following proposals capable of Regional initiation as "Variation Amendments," viz. :—

(*a*) A mutually-agreed scheme to cover payment for time lost over which the workman has no control;

(*b*) An allowance of 3s. per week for tool money to carpenters and joiners; and

(*c*) A mutually-agreed scheme to cover payment for Bank Holidays and one week during the summer period ?

A.—These proposals cannot properly form the subjects of "Variation Amendments," as their effect, if adopted, would be to introduce into the agreement provisions of a character entirely different from any now contained therein.

Q.—Is it competent for a Regional Joint Committee to recommend a variation of a national rule to apply only to part of its Region, the R.J.C. having decided to deal as a Regional unit with Variation Amendments ?

A.—A Regional Joint Committee, in the circumstances described, is entitled to recommend that a proposed Variation Amendment shall apply throughout its Region or to such particular Area within its Region as may be specified.

Submission : That the proposal to add other descriptions of work to the schedule contained in Working Rule 3 is not admissible as a "Variation" amendment, in view of the agreed definition that a "Variation" Amendment is one which proposes to vary a detail. It was submitted that this should be interpreted to mean that each particular item contained in the schedule of Rule 3 is a detail of the agreement, and that accordingly the application to Rule 3 of a "Variation" Amendment should be limited to varying these particular items.

Reply : The definition of a "Variation" Amendment, to which reference is made, follows immediately after the definition of a "Constitutional" Amendment as set out below :—

1. A "Constitutional Amendment" means one which proposes to alter the essence of this Constitution or any Agreement essential thereto as distinguished from—

2. A "Variation" which proposes to alter a detail thereof.

These definitions are complementary and accordingly they must be read together. When read together the word thereof, at the end of definition 2, refers to the Constitution and not to the detail of a particular agreement.

The essential part of the Agreement contained in Working Rule 3 is the provision for payment of extra wages to workmen engaged upon certain classes of work.

The schedule of operations for which extra wages is payable is, in its entirety, a detail which may be enlarged or diminished by means of variation amendments, always provided that any items added come within the description "Classes of Work."

The election of officers then took place. On motion made and seconded, Mr. W. E. Collier, who was heartily congratulated on his restoration to health, was unanimously re-elected chairman. Mr. Thomas Barron was unanimously re-elected vice-chairman. Messrs. A. G. White and R. Coppock were re-elected joint secretaries. Messrs. J. Davidson and A. G. Gossling were re-elected auditors. Mr. A. J. Lloyd was re-appointed clerk. Committees were appointed as follows :—Employers' representatives : Messrs. J. P. Cox, J. Davidson, A. J. Forsdike, J. C. Gilchrist, E. W. King, and F. Thorne. Operatives' representatives : Messrs. A. Gill, A. G. Gossling, I. Marks, W. Pickles, S. Sigsworth, and S. J. Wright. Employers' representatives : Messrs. J. H. Barker, J. P. Cox, A. J. Forsdike, F. G. Hodges, and E. W. King. Reserves : Messrs. F. Thorne and R. J. Wormell. Operatives' representatives : Messrs. J. A. Gibson, H. McPherson, S. Taylor, R. Wilson, and F. Wolstencroft. Reserves : Messrs. A. G. Gossling and F. Kennedy.

"THE APPRECIATION OF THE CRAFTS"

The Welsh Department of the Board of Education, Whitehall, S.W.1, has issued a pamphlet (Form 1050, Wales) on the subject of a short introductory course in "The Appreciation of the Crafts" for Teachers in Wales, 1927. Extracts from the pamphlet are as follows :—The Welsh Department of the Board of Education has been impressed with the need for a greater recognition of the value of craftsmanship and good workmanship in everyday life in Wales. In order, therefore, that teachers in Wales, who can do so much to influence the common standard of judgment and appreciation, may see and study for themselves what is being done to-day by capable students and craftsmen, the Welsh Department of the Board of Education has made arrangements for a short introductory course in "The Appreciation of the Crafts" to be held in London at the Royal College of Art, South Kensington, S.W.7, from August 2 to August 16, 1927. The course, which will have as its main object the demonstration of the bearing of good craftsmanship on daily life, is intended to give teachers an insight into the aims and methods of workers in woodwork, pottery, embroidery and lettering. There will also be introductory general talks on the appreciation of art to emphasise what it is that differentiates insincere and pretentious workmanship from work which derives its beauty from its sincerity and from the adaptation of the material to its fit purpose. It is hoped to make arrangements with the Rural Industries Bureau for teachers attending the course to be afforded opportunities of learning something of the work of this important organisation, which aims at giving information and advice to the rural workers or to persons wishing to engage in or to promote rural industries. The Bureau is prepared to give information and advice to inquiries as to various country trades and crafts, viz. :—Metal work, including blacksmithing and mechanical repair work; woodwork, including wheelwrighting and woodturning; underwood crafts; osier-growing, basket-making, and rush work; hand weaving and spinning, rug making; the utilisation of straw, peat, sawdust, and other waste products; book-binding, as an adjunct of school-work (on lines similar to those in operation, for many years, in some Cardiganshire schools). The course will be under the special direction of Dr. W. Williams, Divisional Inspector for Wales, who will be assisted by Mr. J. M. Holmes, Slade Diploma of Fine Art, together with an expert staff. Details of the course will be forwarded later to the teachers selected to attend.

TOWARDS A SCIENCE OF BUILDING

The work done by his Department was the subject on Thursday week of a lecture delivered by Dr. R. E. Stradling, Director of Building Research for the Department of Scientific and Industrial Research. The lecture was delivered at the Institution of Structural Engineers, Upper Belgrave-street, London, S.W., and was illustrated by lantern slides. Mr. H. J. Deane (President of the Institution of Structural Engineers) was in the chair.

The lecturer said that the idea of experimentation in such an industry as building was not new; the history of the industry itself was one of experimentation; we thought of it as founded on traditional knowledge, but that knowledge had been built up by practical experience, which was really experimentation on a large scale. He expected most of those present knew the story of the old bridge at Pontypridd. That bridge was the work of William Edwards, a self-taught mason, who after being a shepherd on the hills drifted into the building of dry walls. From this he got on to more elaborate masonry, and to get further experience articled himself to some masons at Pontypridd. He made a name for himself, and at the period immediately before the building of railways, when there was a great development of roadmaking in this country, he found himself commissioned to put a bridge over the Taff at Pontypridd. He had, of course, received no training in theory to qualify him for the task, but set to work as a practical man. He built a bridge of three arches with piers in the stream, but when storms came and piled up débris against those piers that bridge was swept away. Then he built a second bridge consisting of a single arch. But that arch was very heavy at the haunches, and very thin at the crown, and when he had nearly completed the parapet walls the keystone was forced out and the bridge collapsed. The kind of instinct which develops in every structural engineer worth the name made Edwards feel that the haunches of his arch were too heavy. So when he started again he put three holes through each of the haunches, and thus he successfully completed a bridge which stands to this day. It was by methods such as those of Edwards that the pioneer had to work, and the object of such a Department as that of Building Research was to experiment on a small scale, bringing in the work of the mathematician, the physicist and the chemist, so that such large-scale experimentation should not be needed. Laboratory tests, however, were no good until they had been checked by practical experience. Of problems now being studied, those concerning the weathering of various materials constituted one of the most important groups, all the more important because so little was known on this subject. The endeavour was made to compare things by frost tests, chemical tests, and so on. The ideal was to be able to design for weathering conditions in the same way as an engineer could design for strength; but at present this was impossible, and it was not even certain that the tests now being applied had any real bearing on practical conditions. In this connection, three major problems were receiving attention: the development of accelerated weathering tests, the mixing of materials for concrete, etc., and the preservation of stone; and as regards the mixing of materials a certain amount of entirely new work had been done. Everybody realised that a rise in temperature meant expansion for the majority of materials: it was not generally known that an increase in moisture content produced a similar result. You might get simultaneous movements in a material due to both these causes. Associated with the expansion due to moisture was an extraordinary change in the physical properties of the material: one rather striking case was that of the Yorkshire sandstone, where the difference of strength might amount to 50 per cent., according to whether the material was absolutely dry or absolutely wet. Investigation had now shown that materials showing this moisture expansion were what the physical chemist called "jells," and the ascertainment of this fact was a real step forward in our knowledge of this type of material.

In a later part of his address the lecturer dealt with the research now being carried out along this line, saying that an instrument called the extensometer had been invented and made to test and measure the expansion or contraction of an object through absorption of moisture or evaporation. He explained the method by which this instrument worked, and said that with most things submitted to it, especially concretes, the first drying out was what mattered most.

Heating and ventilation were among the matters of which the lecturer spoke as being the subject of investigation at the Building Research Institution, and for this purpose a cottage had been built, he said, in the grounds where the experiments were carried on. For many years conductivity tests had been taken for special building materials, and most people had realised that those tests did not work out in practice. One reason for this was that it was very difficult in a laboratory to know what kind of heat transmission you were going to get in a hollow cavity wall. Another thing not known was the effect of changing surface on the outside, although it was known that this effect was very marked. Nor was the effect known of wind, rain, and so on. In a small wooden shed experiments were being made with thin roofing materials, and it had been demonstrated that when the roofing material was very thin it did not matter very much what the substance was. It might be iron or it might be asbestos, for heat did not go through very thin material by conduction but by radiation. To test the condensation of water on internal walls a little machine, specially invented and constructed, enabled a comparison to be made between different materials. It was interesting to know that a sheet of asbestos cement sheeting, if unpainted, would resist any tendency for water to condense upon it very well indeed; but a coat of some distempers now on the market, which had more oil in them than was usually realised, would cause condensation.

Among other things to which the lecturer alluded was the effect of indiscriminately placing building stones together. In one case he illustrated, where a building was of limestone in the upper stories and sandstone in the lower, the sandstone had disintegrated. Examination showed this was due to calcium sulphate which had come from the limestone.

Speaking of weathering, the lecturer said it was only now beginning to be realised that re-pointing might do more harm than good. Twenty-five or thirty years ago the mortar joints in a great many of our ancient buildings were very badly gone, and with the best will in the world the people responsible for repairing them re-pointed with hard cement mortar. But as a result the stone had now entirely decayed, whilst the mortar was left standing out. This was because water would get into a wall, had to get out again, and in getting out chose the easiest path, which before the re-pointing was through the old porous mortar. After a wall had been re-pointed with a material more impermeable than the stone, the easiest path was through the stone. For such purposes mortar should not be specified in terms of strength but in terms of relative rates of evaporation as compared with the material it was to be associated with.

Another thing of which the lecturer showed a photograph was a shed put up chiefly to allow panels to be exposed to the air so that tests could be carried out on them. One such panel, inside the building, was being used to carry out tests of painting on plaster. Another panel, outside the building, was for the exposure of water paints; and a third was to get rates of penetration for temperature or moisture in different types of build materials. An interesting and import matter now being investigated was that clinker concrete, and a machine had been vented and was being used to measure rate of expansion of clinker due to oxy absorption. One thing that had come but which was already known to a great m people in practice, was that the serious tro that clinker concrete gave was not always to sulphur. A failure when due to sulp took a fairly long time, and if the clinker been exposed for a considerable period heap there was not much fear of sulp The real trouble was with unburned coal, the curious thing was that it was not coal but only certain kinds that caused trouble. The Department were trying to down to which coals and why, but meanw houses were falling down.

Dr. W. N. Thomas, who was introduce the audience as second in command at Building Research Institution, added some marks on work being done there to ascer what effect freezing had on the weathe properties of building materials. He said in some countries frost had a very great e on the weathering properties of stone, br tiles, and materials of that kind. Theor ally, if the pore spaces of a stone were 90 per cent., the 10 per cent. which was was just sufficient for the ice to form wit disrupting the stone; but in actual pra about 80 per cent. was the figure, because water was not evenly distributed. If 80 per cent. of the pore space was filled material would stand the frost action rule; but if the proportion was more about 80 per cent. the material would g ally fail. This was rather different from usual expectation. It was generally sidered that if a material was very poro probably would not stand frost action, experiment showed that it did not matter much what the moisture absorption was vided the pore space was not filled more 80 per cent.

Mr. Andrews, who moved a vote of th to the lecturer, said we were not so def in what might be called the mathem analyses of building problems as in k ledge of the fundamental facts of the mate He was glad to see the Department attacking such problems in the way likely to be useful to practitioners. Di scientific investigation was undertake showed how necessary it was to cast preconceived ideas.

Major Petrie, in the course of some re supporting the resolution for a vote of th said there were three bridges near Cr similar to the one Edwards had bui Pontypridd, with exactly the same through the haunches. They had been across the old Croydon Canal, and spanned the railway not far from Croydon Station.

The vote of thanks was heartily acc and the proceedings terminated.

New Lambeth Bridge.

The chairman of the Improvements mittee of the London County Counci announced that work on the new La Bridge may be begun before the end year. It is also stated that before th bridge is removed a temporary foot brid be erected. The work on the new brid extend over two to three years from th of the contract.

The Shakespeare Memorial Theatre.

Under plans just announced by Pr George Baker, of Yale University, Ame to take a million-dollar (£200,000) share international movement to rebuild and the Shakespeare Memorial Theatre at ford-upon-Avon. In all £500,000 will be so it is stated, throughout the world to co the plans of the new theatre and its ass dramatic school, festival company, m and library.

RATES OF WAGES IN THE BUILDING TRADE

(For rates of wages in the Building Trade in Scotland, see page 668.

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

Following is a list of abbreviations:— Borough Surveyor, B.S.; Borough Engineer, B.E.; District Surveyor D.S.; Clerk, C.; Town Clerk, T.C.; County Engineer, C.E.; County Surveyor, C.S.; County Architect, C.A. Surveyor, S; Engineer, E; Borough Architect, B.A.; Architect, A.

Fifteenth-Century Discovery at Cobham.

An interesting discovery, says the *Morning Post*, has been made by Major Benton Fletcher, of World's End, Cobham, at The Cedar House, close by the Old Mill at Cobham. This is a fifteenth-century hall, dated A.D. 1432, the same date as that of Church Stile House, near the Parish Church. Until recently it had a kitchen, larder, and pantry built inside it. When Major Fletcher bought the premises a brick wall ran across the centre of the hall, but this has now been taken down. The oak ceiling and original beams are still there, whilst across the roof are curved oak collars. There is also a beam of 20 ft., all one piece, across the tie. In another room is an old kitchen with an ancient open fireplace, across which is a spit and an 8 ft. wide chimney breast. The house is shaped like the letter H, with two wings, one of which is a new one, and built as nearly as possible on the old foundations. Outside is a real Gothic doorway, and the entrance gate from the roadway was taken from a house in Kent belonging to Richard Brinsley Sheridan, the famous author and dramatist.

PROPOSED NEW BUILDINGS & OTHER WORKS*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T for Ministry of Transport: C.B. for County Borough; B.E. for Board of Education; M.A.B. for Metropolitan Asylums Board; and M.W.B. for Metropolitan Water Board.

Following is a list of abbreviations:—Borough Surveyor, B.S.; Borough Engineer, B.E.; District Surveyor, D.S.; Clerk, C.; Town Clerk, T.C.; County Engineer, C.E.; County Surveyor, C.S.; County Architect, C.A.; Surveyor, S.; Engineer, E.; Borough Architect, B.A.; Architect, A.

Wheator (London) Ltd.

The Art of Bell-ringing in England

The Norfolk Guild of Ringers have brated their jubilee at Norwich. A luncheon to mark the event, the Dea Norwich said that the Guild of Ringer day represented an art which was wholly absolutely their own. Alone of the na of the world England rejoiced in bells bell-ringing such as was represented in guild. Bells were not unknown on the tinent, but carillon-ringing was very diff from peal-ringing, and it was one of many glories of our dear Motherland tha bells surpassed those of all other coun and that the art of change-ringing was very own. It was in the early part o seventeenth century that change-ringing distinct from round-ringing, was elabo into a science, and with the Restoratio 1660 came a perfect mania for new Ringing became a fashionable pastime societies for its practice were formed, but came a period of blackness and deadness. the coming of the new doctrine in the part of the nineteenth century that ri were Church officers, and that the art be consecrated, a steady improvement and nothing in the history of ringing was remarkable than the way ringers had ris the dignity of their position. In the of the country there were 40,000 me to-day.

Obituary.

The death has occurred, at Torquay, James Thomas Downing, formerly a well-l builder of Penzance. Mr. Downing w years of age.

Slum Clearance in Glasgow.

A further slum clearance scheme has been prepared by the Corporation of Glasgow, and it is proposed to deal with 1,020 dwellings situated in eleven of the more congested wards. There will be an annual deficit of £17,000, of which 50 per cent. will be met by the Government by subsidy for slum clearances. The balance is equivalent to one-fifth of a penny on the Corporation health rate.

THE SCOTTISH BUILDE

NEW BUILDINGS IN SCOTLAND

Renfrewshire.—WIDENING.—The County Council of Renfrew has approved the scheme for the widening and reconstruction of the bridge carrying the public road leading from Glasgow to Kilmarnock by Newton Mearns over the L.M.S. Railway, and widening and reconstruction on the northern side of the bridge carrying Church-road over the L.M. & S. Railway.

Kintore.—HOUSES.—The Town Council are to build two blocks of four houses each.

Aberdeen.—CINEMA.—The cinema which is now being erected on the site of the old Electric Theatre, Union-street, is to cost about £70,000.

Dundee.—CINEMA.—A new cinema of 1,200 capacity is to be erected on a site in Grays-lane, Lochee, by Mr. A. E. Bennall.

Dundee.—BUILDINGS.—A Sub-Committee of the Town Council has decided to recommend the Council to purchase Dundee Prison at the price offered by the Secretary of State for Scotland, at £15,000.

Edinburgh.—BUILDINGS.—The Dean of Guild Court passed the following:—City, pavilion at bowling green, Balgreen-road; Juniper Green Bowling Club Trustees, club house at Lanark-road, Juniper Green; Messrs. M'Donald, Donaldson & Low, six houses at Craiglockhart-road; Royal Edinburgh Asylum for Insane, an outpatients' department at Jordan Burn Nursing Home, and a porch at West House, Morningside.

Hamilton.—HOUSES.—The Dean of Guild Court passed plans for the erection of 118 houses at Low Waters to supply accommodation for dispossessed tenants of uninhabitable houses in the burgh.

West Calder.—EXTENSION.—The Midlothian Education Authority has approved a recommendation of the Building Committee in connection with the extension of West Calder Roman Catholic Schools, which is estimated at £4,800. The Superintendent of Works been instructed to proceed with the prepara of plans and specifications. He has also instructed to prepare sketches for the exten of West Calder High and Bonnyrigg School

Hamilton.—HOUSES.—Plans have been pa for 66 houses at Linhouse and 14 at Yews.

Inverness.—HOUSES.—The Town Council shortly embark upon another scheme for houses.

Kinghorn.—HOUSING.—The Housing C mittee has reported that the total cost of 40 new houses to be built at Baliolfield wi £15,729.

Prestwick.—HOUSES.—The Town Council agreed to proceed with the erection of additional houses, 40 houses to be erected Glenburn, and 36 at the Waterloo-road site

Kirkcaldy.—HOUSING.—The Fife Council approved the scheme for the erection of houses at £120,000.

Criagewan.—SHELTER.—The Peter Feuars' Managers have reported that the of the shelter and tea-room to be erected be £1,114 18s.

Tarbert.—IMPROVEMENTS.—Every availa piece of ground suitable for curing station been acquired for the proposed improvem It is proposed to erect a new breast running in a westerly direction from the n west point of the original stone quay, an reclaim the space between this and the exi wall. Besides thus providing greater ac modation for herring curers, berthing faci will be improved.

Glasgow.—SLUMS.—Details of an exte slum clearance scheme to be carried out b Corporation involve 1,019 houses. The la area included in the scheme is the quadr formed by Main-street, Franklin-street, ford-street, and Reid-street, in the Brid district, where it is proposed to clear the ex buildings and at a later date to build hous the site. The estimated cost of the sche about £480,000.

Ayr Water Scheme.

It has been intimated at an Ayr Town C meeting that arrangements had been with the L.M. & S. Railway, and wit Ayrshire Electricity Board, to withdraw opposition to the Ayr Burgh Water which seeks power to obtain an addi supply of water for the burgh from Loch R at an estimated cost of £250,000. This the County Council as the only oppone the Order, and negotiations are proc with them to give them the supply of that they desire.

New Housing Scheme at Airdire.

At a meeting of Airdrie Town Council stated that the Board of Health had ap of the Council's purchase of the lands of hall, and of the lay-out and type plans new slum clearance housing scheme for th tion of 160 flatted houses (120 of three ments and 40 of two apartments). Offer accepted for the building of the first inst of these houses, which worked out at £353 per house, and the second instalment worked out at £320 15s. 4d. per house.

Cathcart Castle.

Following the recommendation of thei committee on Parks, &c., Glasgow Corp have decided to accept the offer by A. J. & A. Graham, on behalf of Earl Ca to sell to the Corporation ground, extend 18,633 acres or thereby, adjoining the Park, together with Cathcart mansion and offices and the adjoining historical C Castle, at the price of £2,300 subject to conditions.

ESTIMATING ON RIGHT LINES

Everyone whose business it is to quote for building work should master the principles upon which estimating is based. These principles are clearly explained and illustrated in

'HOW TO ESTIMATE'

by J. T. REA,

a unique and invaluable work which is not excelled in thoroughness or in scope by any similar book known.

Fourth edition (now ready). 540 pages. Price 15s. net (by post 15s. 9d.). Containing thousands of prices and hundreds of examples of analysis, showing how a builder can make up rates for himself. In view of the difficulty of fixing standard prices under present conditions, the author has included an important series of Adaptation Tables and Percentages (corrected to February, 1927), *which show how rates may be adjusted to meet variations at any time.*

Before purchasing any other book on this vitally important subject, you are invited to inspect this—the standard work which is in use by over 30,000 builders.

A COPY WILL BE SENT BY RETURN, AND YOUR REMITTANCE REFUNDED IF THE BOOK DOES NOT SATISFY YOUR REQUIREMENTS.

B. T. BATSFORD, LTD.
Publishers, 94, High Holborn, London, W.C.

EVESHAM.—Bathroom at the isolation block, the B.G. Mr. R. J. Atkinson, Union Offices:—

CXXXII.—No. 4395. APRIL 29, 1927.

TREELESS TRACKS

RECENT comments in the daily press strike a fresh warning concerning the activities of the "arbiter of our destinies," who, it would seem, sits "with a survey map and a ruler," directing from afar the transformation of rural roads. It is perfectly true there is a new kind of beauty in the wonderful efficiency ie new roads; it is true, as *The Times* points out, that the roads "suggest power and purpose; and power and purpose their charm no less than the gentle, casual air of the old s." But there is little consolation in the suggestion that e steely surface" of a new road "can take on lovely irs," and "reflects trees and clouds almost like water," n, as a Surrey sufferer laments, "there will be no trees lett flect." It is the same story in Essex, the same story else- e: "there will be no trees!" With an ever increasing oughness, the countryside is being denuded of its verdure. s beside the country highway make way for a curbed path. s and hedges in country lanes follow suit, first at the corners, along the stretch of straightened road.

our idea of beauty so changed that we can find pleasure in efficiency for practical, material ends? A soulless lence is surely no very noble aim. Can we contemplate equanimity the prospect of a treeless England where no sing? Dare we welcome visions of a time when roads have ne completely standardised, completely straightened, and letely cleared of all trees? Will a time come when field woodland has all been claimed for houses and factories ieroplane parks?

e Memorandum concerning the projected Regional planning ment in Scotland contains a convenient but unfortunately guous little phrase. "Of course," we read, "it is intended great care shall be taken not to spoil the beauty of the ands in the process of industrial development." But ulous care has not always been a matter "of course" ilar development in English beauty spots, rather has it he result of more or less accidental interference by private is anxious to prevent thoughtless and shortsighted dis- ment. There is, indeed, no fundamental exaggeration in ar expressed that "they may soon do for the Highlands they have done for Bournemouth, leaving a few straggling which you can go and see as trees."

, to go and see a tree, as something out of the ordinary, hing artificially or accidentally preserved, and therefore ue as a spectacle, may be added ere long to the list of le goals for the motorist sated with expeditions, such as suggests, to scenes of crime or mystery or mishap. It is e to learn that church authorities in one of London's ds" have deliberately cut down some fine woodland trees e they overshadow a dahlia bed; but it is a lesser sin he wanton outrages, the "heedless vandalism," which e straight treeless tracks in rural districts.

en speed was a new joy the ten mile straight road near g offered added delight to the ardent motorist. Speed, it is not a business necessity, is now no longer a bracing y but an obsession. The motor tour and charabanc ad their origin in two distinct but allied motives. First the delightful novelty of travelling, no matter whither, automobile vehicle. Then came the increased and read desire to travel and see things and places of beauty er special interest. Increased facilities for travel by ncouraged the wish to do so. The strain of highly x urban and suburban life increased the desire to get o quiet and refreshing natural surroundings. But now d is defeated by its own attainment.

There is a poignant irony in a certain current advertisement for motor cars, in which a pretty little picture illustrates a tree-lined road, innocent of footways, unless the grassy margin bordering the woodland can be so called. The road bends sharply to approach a typical English country village, and again to cross an ancient stone bridge. Tucked into the first angle is the village church, with a shallow porch reached by steps direct from the roadway. Nestling in the other angle is a snug little thatched cottage, its apple tree overhanging the rise in the road where the bridge begins. This is the kind of rural beauty spot that the world on wheels is pursuing. Yet the picture might cause a "road improver" much disquiet until the portrait were proved untrue. That bridge is obviously the first thing to attend to. The thatched cottage at the corner is a menace to traffic, for it makes it necessary to slow down in order to see what may be coming through the village. Down with the cottage, and its poplars behind. Both are a source of inconvenience. Ah! yes; that charming little church, so confiding at the wayside corner. Just set the porch back a little lest the churchgoers, lingering at their after-church gossip, impede the Sunday traffic. The churchyard yews, the hedge and the elms must be cleared away, and the corner rounded off for the convenience of people in frenzied search of the quiet beauties of the countryside. Now that you have cut down the hedge, and cut off the corner, and cut down the yews and the elms, why not join the straightened portion of the road at the new iron bridge to where a line extended thence meets the main road? Hack away the hedge, hew down those wayside willows by the little pond, tear up the turf, burn the brushwood. In a few short weeks you may reach with increased speed this place of quiet that your soul craves.

But do not expect the sound of the blackbird in Spring, for his habitat is a hedge, and a trim fence is to him no fair substitute; in autumn do not look for the red glow of fruit in the orchard, for the fruit trees have given place to an iron standard supporting a highly coloured admonition to eat more apples; do not inhale in happy anticipation the wet fragrance of autumn leaves, for the trees that bore them have vanished, and the goal that the tired townsman envisaged has gone for ever. True, there may be a village pump—a petrol pump. It is a curious anomaly that while tree-planting is a recognised branch among the subsidiary arts and sciences concerned with town planning there appears to be no organised or recognised idea that the preservation of ancient trees in country districts is as vital to the maintenance of "amenities" there, as are any of the factors in the planning of a town. It is true that a town planning expert advocates that "main roads, where they pass through villages, should be obstructed with trees . . . so that it should be impossible for a motor vehicle to thread its way through a village, or market town, at more than a crawl." But the trees here are mentioned in association with monuments and lamps, and are by inference specially planted new trees.

Thought and action are being urged concerning the use of building materials appropriate to the surrounding scenery and the soil from which they spring. But if our country roads become treeless tracks it will matter little what the hand of man perpetrates: he may blindly erect beautiful half-timbered dwellings in a district denuded of oaks.

Only a timely and courageous resolve to take the needful step backwards can place modern man once more upon a sane and happy *via media*, where, in a phrase aptly applied recently to another problem of progress, he may succeed in "protecting himself from his own inventions."

H

NOTES

Royal Academy Election.

The election of Mr. E. Guy Dawber, President of the Royal Institute of British Architects, as an Associate of the Royal Academy will, we are sure, give considerable pleasure to Mr. Dawber's friends and those who are familiar with his architectural work, as well as to members of the Institute as a whole. Though Mr. Dawber's practice has by no means been confined to domestic architecture, he is perhaps best known as being responsible for some of our best modern domestic work, and when it is remembered that he has been designing houses for many years past of the charm and character of those we publish this week from the Exhibition of Architecture now being held in the rooms of the R.I.B.A., it is surprising that the honour has not been conferred upon him before—at least it would be surprising if we did not know that there are other architects who are certainly entitled to the honour, whose claims appear to be ignored time after time. We are accustomed to this slight of Art in the Honours Lists published by the Government from time to time, and we are not altogether surprised, for we hardly expect a real appreciation of Art from those responsible, but it is a different matter with the Royal Academy of Art, from whom we should expect a ready recognition of the claims of our best artists to distinction for their Art and for their Art alone.

The R.A. Exhibition.

The number of exhibits in the architectural gallery at the R.A. seems small—about 177, and quite a good space is occupied by mounts, needless skies and unsuccessful competitive work. Two needlessly large models are exhibited of great new buildings which will probably fit into their allotted sites quite agreeably, but which are hardly captivating exhibits as here shown. The designs in the gallery suggest, on the whole, a fairly steady hold on tradition except in commercial street design, which continues to show ingenuity and vitality. The hanging of the designs has probably caused some trouble, for the result is not very happy, and there can hardly be said to be anything which captures the imagination. As usual, several excellent subjects have been rejected, and the ever-recurring question arises as to what principles guide the selection, or whether there are any at all! We can hardly understand why it should be necessary to hang subjects which are utterly unworthy of public exhibition. There are a few adequate and pleasing illustrations of buildings, but the tendency to exaggerated effects still remains. Perhaps a more cultured and refined expression will come some day. There is only one absentee architectural member of the Academy this year, Mr. E. S. Prior. Mr. Tapper has three exhibits. Sir Reginald Blomfield three. Sir Edwin Lutyens one. Sir Giles Scott two. Sir R. Lorimer one. Sir Herbert Baker one. Sir J. Burnet two and Mr. Curtis Green six.

Notable Omissions.

Knowing something of the quality and importance of much of the work which is being done at the present time, one finds it difficult to account for the absence of representation of some at least of the best examples. For instance, the latest and one of the best of our new theatres might have been exhibited and we wonder why we do not find in this exhibition some drawings of Sir Edwin Cooper's excellent work which we have illustrated from time to time in our pages. It is to be regretted that Sir Edwin has not for some years sent to the exhibition. Other instances, of course, might be given, and we can only regret that more effort is not made to make the exhibition more representative.

Rejections at the R.A.

Each year as the season comes round, the usual complaints are forthcoming in regard to the rejection of pictures by the Royal Academy. When so many thousands come under review in so short a sp of time, it is hardly possible that jus can be done in all cases. We do not thi however, it is altogether reasonable artists who submit their work to tribunal to complain if, unfortunat they are not accepted. These h aggregations of pictures at the Acade are in themselves open to some quest and it is more possible to criticise position of an institution which leads such centralisation and dependence. dependence of the artist in this way not altogether healthy, and the freed of art from such institutional contro more to be desired than any access of its strength. The arts function when free from control.

The Illustration of Architecture.

Are we going somewhat the other extreme now, the artistic representat of architecture at Academy and other pla so that the representation seems more importance than its subje This query is suggested by the comm on the Institute Exhibition of Archi ture. It is, we suppose, gener assumed that the object of the exhibit the Architectural Gallery at the R. is chiefly to interest the general pu and that the gallery is certainly no be considered as mainly an appea architects themselves. If this is s is surely right that every reason effort should be made to place architectural designs in an attra and pleasing form. But this is no say that the means should take the of the end. We do certainly think the right balance is often very wro overthrown, and that the represent of architecture in far too many leaves the true architectural badly out of account. There is no to make the illustration of a bui ineffective because it does not m proclaim the draughtsman's skill. probably the increasing vogue for col drawings has led to a very unfair misguided sense of values.

From the R.I.B.A. Exhibition of Modern British Architecture.

A House at Witney, Oxfordshire. Model.

Mr. Oliver Hill, F.R.I.B.A., Architect

From the R.I.B.A. Exhibition of Modern British Architecture.

Portmeirion Holiday Village.

Mr. Clough Williams-Ellis, Architect.

There is some justice in the point made by an art critic that the exhibition of the work of English artists now being held under the Duveen scheme, has missed the opportunity of re- the more especially English ristics in what is shown. artists either trained in Paris, ving a decided Continental in- in their work, are not as likely iliate French approval as work more evidence of native de- English art suffers from a litanism that is really not its t point; rather a loss which suffered from want of stability wn traditions. English art has glorious qualities deriving its from racial characteristics from the French, who are more be attracted by these than by imitations of their own outlook. Unfortunately, the governing impulse of those who have so much of the direction of these affairs is towards these Continental influences, but we shall be more likely to secure the attention and the encouragement of France when we hold more independently to our own traditions.

British Architects' Conference

The Annual Conference of British Architects, postponed in 1926 on account of the General Strike, will take place in London from June 20 to 25, inclusive. All members of the R.I.B.A., the Architectural Association, and the Allied Societies in Great Britain, Ireland and overseas are invited to take part in the Conference. It is hoped that many ladies will be present, as guests of members, at all the events contained in the programme. Non-London members are urgently recommended to make arrangements for their accommodation in London during the Conference week at the earliest possible time. In the height of the London season the hotels are liable to be very full. The Executive Committee remind London members of this welcome opportunity of offering private hospitality to their friends from the provinces who will be coming to London for the Conference week. So much generous hospitality has been extended in the past to London members attending the Conferences in the provincial centres that this opportunity of returning it will no douot be warmly welcomed, and it is hoped that members will lose no time in writing to their friends in the provinces on the subject. A complete programme of the Conference, giving all particulars required by those who propose to attend, will be issued in the near future. No doubt the organisers will be glad to know at the earliest possible moment the names of those who will be attending, for the difficulties of arranging a meeting on so large a scale must be considerable.

The Future of London.

One of the best papers which has been read before the London Society was that by Professor Richardson on Friday last on modern street architecture, for it was pertinent to the special aim for which the London Society was founded, and it struck a note of some real insight and imagination as to the future. All railways banished to within five miles of the centre of the city—no wheeled traffic within half a mile of the Royal Exchange—real direction and restriction of traffic—moving footpaths—the city freed from warehouses and given over to offices—these are items in the Professor's suggested reforms. It is really a very serious problem as to what is to happen for the future of London. If we could possibly be wise in time, if we could visualise the future with its possibilities for good and ill, we might still be in time to save London from its terrible congestion and perhaps build up something fine and noble out of its present chaos of old and new.

From the R.I.B.A. Exhibition of Modern British Architecture.

Portmeirion Holiday Village. Model.

Mr. Clough Williams-Ellis, Architect.

GENERAL NEWS

Surveyor's Estate.

Mr. Robert Bruce, of Wraylands, South Cave, Yorks, land agent and surveyor (net personalty £3,642), left £11,431.

Surveyor's Retirement.

Mr. Norman Scorgie, J.P., M.Inst.C.E., borough engineer and surveyor of Hackney, is retiring after 49 years' service.

Engineer's Estate.

Sir Whately Eliot, M.Inst.C.E., of Inglewood-road, Hampstead, N.W., who died on December 3, aged 85, left estate of the gross value of £11,878.

The Preservation of Ancient Cottages.

The Mercers' Company have contributed £100 and the Carpenters' Company £52 10s. to the Royal Society of Arts Fund for the Preservation of Ancient Cottages.

An Artist's Retirement.

Sir Ernest Benn recently gave a luncheon at the Waldorf Hotel, London, in honour of Mr. William Baldock, who is retiring from the staff of Benn Brothers after 43 years' service as an artist.

A New Californian Bridge.

It is proposed that a bridge should be built across San Pablo Bay, California, at a cost of 12,000,000 dollars (£2,400,000). It would be 14,600 ft. long, with a carriageway of 30 ft., and a clearance for shipping of 135 ft.

New Garden City at Derby.

A firm of Derby builders are, we understand, building 160 houses at Breadsall, three miles from Derby, and intend to let the whole of the dwellings to specially selected tenants. The houses are being erected on garden-city lines.

Restoration of Rheims Cathedral.

The restored cathedral of Rheims is to be opened again as a place of worship on May 26. A solemn Mass of Thanksgiving is to be celebrated by Cardinal Lucon, and among those present will be delegates of the Rockefeller Foundation and of the British and Danish committees, through whose medium contributions have been made for the restoration of the building.

Development of Windsor Forest.

A scheme has been submitted by the Commissioners of Crown Lands for the development of part of Windsor Great Forest by building and also by laying-out two 18-hole golf courses. There are also, it is understood, about 1,200 acres capable of building development as a high-class residential estate, which since the war have been lying derelict owing to the expense that would be incurred by replanting.

Painting the Opening of Canberra.

The Commonwealth Government, so it is understood, is commissioning Mr. M'Innes and Mr. Harold Power, two of the foremost Australian artists, to paint two pictures of the opening of the new capital at Canberra by the Duke of York. One picture will depict the scene inside the King's Hall, and the other the ceremony in front of Parliament House. Mr. Power was late official artist to the Australian Imperial Forces.

Altrincham Spire in Danger of Falling.

The spire of St. Margaret's, Altrincham, is in such a dangerous condition that restoration has become urgently necessary, and it is estimated that the rebuilding may cost quite £5,000. Numerous fractures were found in the stonework, and in the opinion of the architect, Mr. H. C. Killinder, of Liverpool, the whole of the spire will have to be dismantled before rebuilding can be safely undertaken.

Arab Architecture in Madrid.

An Arabian monument dating back, it is understood, to the eleventh century, has been discovered in Madrid. Whilst studying the ancient parish church of San Nicolas Professor Elias Tormo noticed what appeared to him to be Arabian bricks in the walls of the narrow stairway leading to the top of the church tower. Further investigations showed that a part of the tower had been built into a previously existing building of Arabian or Moorish origin. At length a platform or balcony was uncovered, this proving to be identical with that used by the muezzin of the mosque in proclaiming the summons to prayer to the Mussulmans.

A Saxon Church.

Excavations (according to the *Times*) have recently been made at Deerhurst Priory Church, which dates from Saxon times and is situated at the extreme north-west corner of Gloucestershire, two miles south of Tewkesbury. The plan of the present church comprises a western tower, a nave, and north and south aisles. The original plan included an apsidal presbytery, a choir flanked by chapels, and an oblong nave with a western tower. The site of the apse and its side chambers, which were previously overbuilt by farm buildings, was recently acquired, enclosed, and vested in trustees, and the site excavated by Mr. W. H. Knowles, F.S.A. The precise plan of the eastern arm of the church has been definitely determined, and other investigations made. All the indications go to show that the foundations and the superstructure are of one build. The additions, still Saxon in date, to the original fabric of cross form were two square-ended chambers opening out of the side chapels and flanking the apse; and west of each chapel another, which overlapped the nave and incidentally disproves the possibility of aisles. The minor investigations included the excavation of the area west of the tower, but not a single stone was discovered to suggest the existence of a baptistery or other buildings at the point.

The Oldest Building in Oxford.

Excavations undertaken during the last few days in the "Mob" quadrangle at Merton College, following a re-examination of early documents, have had some interesting results. The excavations were made with the object of locating the site of the old church of St. John the Baptist. The church is believed to have been either a Norman or a Saxon building. It was old and ruinous in 1265, and is known to have stood somewhere near the present college chapel. Both the church and its "anchorhold," or anchorite's cell, are more than once mentioned in documents of the college. The documents connected with the earlier buildings of the college have recently been re-examined and one or two new documents have come to light. From these it seemed probable that the north wing of the "Mob" quadrangle was constructed in 1306 on the site, or a portion of the site, of the old church, and the excavations were undertaken in order to test this hypothesis.

A trench was dug in the north-east corner of the quadrangle and the foundations laid bare. The north wing, says the *Times*, was found to rest on what seemed to be two sets of foundations, going 6 ft. below the present ground level, but the widening of the trench yielded a still more interesting discovery. Immediately south of the north wall of the quadrangle were found the remains of a stone-built chamber of uncertain character and purpose. The chamber goes to a depth of some 6 ft. below the surface. Three walls of it survive, each of a height of about 3 ft. The original height can only be conjectured. Of the three walls, two, which run parallel to one another, are six feet in length. The third wall, which backs the other two on the south, is about four feet in length (measured internally). The wall of the quadrangle runs almost due east and west. As the long walls of the chamber run towards the wall of the quadrangle at an angle of about 45 deg., it seems clear from the orientation that the chamber can hardly have formed a part of the church. The conjecture that the chamber is the old anchorhold is only provisional, and further excavation may throw new light upon its character.

COMPETITION NE

Royal Society of Arts' Industrial Des Competition.

By permission of the Board of Gover the Imperial Institute, this year's Society of Arts' Competition of Industri signs will be held in the Indian Pavilion Imperial Institute, South Kensington. Full particulars of the scholarships and offered can be obtained from the Secret the Royal Society of Arts, Adelphi, Application for forms of entry, labels, a structions must be sent to the Secretary Society between May 2 and May 15. designs entered for the competition m forwarded to the Imperial Institute be June 20 and June 22, and after the ju which takes place in July, the accepte signs will be on view there during the of August.

"Stepney Housing Association."

A "Stepney Housing Association" ha formed for the purpose of improving th housing conditions without the wholes molition contemplated under the H Act, 1925. The Association consists of lords, tenants, and others interested problem and is entirely voluntary. M Victor Kerr, L.R.I.B.A., M I.Struc.E been appointed honorary architect.

Mont Saint Michel.

It is estimated that every year Mont Michel, the famous rocky islet off the mandy coast, is visited by 400,000 p Hitherto, the arrangements for their re have been of a somewhat primitive cha but it is the intention of the authori make a fashionable beach on the coast the island with the remains of the Bene monastery. The committee is headed Guerite, the chief architect of historical ments of Versailles. The scheme incl marine wall; a large 300-room hotel in Norman style; and a casino with g together with horse, automobile and bo vice to the beauty spots. A sum of 60,000,000 francs is to be spent on the

Municipal Technical College, Rother

The Education Committee of the Borough of Rotherham propose (as announced in *The Builder* for Ap to erect a technical college and sc art on a site in Howard-street, and architects to submit designs for t posed buildings in accordance wi published instructions. Professor Adshead, F.R.I.B.A., is the a Premiums of £200, £100 and £50 awarded. Competitors desiring planation of the conditions must their questions in writing to the S for Education, Education Offices, I Buildings, Rotherham, not late June 22nd, 1927. All questions submitted to the assessor, and his will be sent as soon as possible competitors, and will form part conditions and instructions. A pla site is supplied with the conditions structions. This plan clearly sh levels of the ground and the positi depths of sewers. The architectur ment is left to the discretion of t petitors, but due consideration given to the practical requirement building, which it is desired to e the sum of £60,000. Provision sh made in the design for future ex and the plans should indicate in wh ner such future extensions might vided, but such possible extension not affect the present proposals, wh be planned as a complete scheme cations for the conditions must before April 30th, to the Secretary cation.

The Carlton Theatre, Haymarket, S.W.

Mr. Frank T. Verity, F.R.I.B.A., Architect.

ROYAL INSTITUTE OF BRITISH ARCHITECTS

EXHIBITION OF MODERN BRITISH ARCHITECTURE.

Mr. Walter Tapper, A.R.A., was in the chair at the Royal Institute of British Architects, 10, Conduit-street, W., on Tuesday, when the Rt. Hon. Viscount Peel, P.C., O.B.E., First Commissioner of Works, formally declared the exhibition open.

The Chairman, in calling upon Lord Peel to speak, said that he had to convey the regrets of the President, Mr. E. Guy Dawber, A.R.A., F.S.A., that he was unable to be there owing to his presence in Italy.

Lord Peel said that one of the reasons why he had been asked to open the exhibition was that he was not an architect. He thought that perhaps it was better that the job should fall upon a layman. The object of the exhibition was the promotion of knowledge of the art of architecture. The present show was the first of a series of exhibitions of models, photographs and drawings of modern British architecture. It was not intended as a competitor to the Royal Academy, and anyone could send to it. Goodness was the only test. The Institute had held exhibitions of American and Swedish architecture, and it was hoped to follow with exhibitions of the architecture of other nations. The object was to educate —or more kindly to enlighten—the public in architectural art. On the other side, it was intended to arouse public opinion against bad architecture. He divided the public into three classes. First, those that had knowledge; secondly, the class that were absolutely insensible, and lastly, the class who were not insensible but were largely unaware of architectural values. It was the object of the exhibition to help this last class.

He thought that appreciation of beautiful architecture was growing in this country, as judged from the interest taken in ancient buildings.

Speaking of the Office of Works, the speaker said that it would be pardoned to him if he said that in his department they had for years been trying to introduce beauty, dignity and feeling into such homely buildings as post offices, telephone exchanges, etc., not only in the more important towns, but in the lesser. In the words of Thucydides, "We are lovers of beauty, but we practice economy." The Office of Works were happy in their association with the members of the R.I.B.A., and he thanked them for their co-operation.

Application of science to building had led to the exclusion of æsthetics. But it would take away very largely from the value of Architecture if she could not successfully meet this difficulty that commerce had set her. Another point was the great peril to the countryside that the habit of leaving towns for the countryside had brought, through the haphazard erection of bungalows, etc. From those evils he looked towards the R.I.B.A. to deliver them. He would declare the exhibition open.

The Chairman then thanked Lord Peel for his remarks, which they had followed with great interest, saying that he had spoken of everything that architects really loved. The proceedings then terminated.

NOTES ON THE EXHIBITION.

A pleasantly hung exhibition of some 233 frames and ten interesting models should provide opportunity for some more or less agreeable reflection on modern architecture. It is mainly an exhibition of comparatively small buildings, and a great deal of it is doubtless already known to our readers, but it is a collection of work which inevitably commands some careful attention. We must confess that it is in the smaller buildings that the architects show the most marked success. Amongst the larger works Sir Edwin Cooper's (78) The Star and Garter, Richmond; Messrs. Mewès and Davis' (115) Westminster Bank, Threadneedle Street; Mr. Moberly's (120) Warrington Training College; and Messrs. Ashley and Newman's (121) Masonic Peace Memorial are the most noticeable. It is curious that architects are not better versed in the art of presentment of their buildings. A photograph can be produced so as to give a more or less sympathetic representation of a building, but there are photographs here which, partly through a wrong point of view and partly by unfortunate emphasis, do much to discount the value of the design. As an example one may note 156, a clever, bright photograph of Messrs. Adams, Holden and Pearson's Westminster Hospital. We think the architects have done wonders in giving a little more character to what was a very hopeless building, but the illustration seems to us to obscure rather than emphasise the excellent character of their work. Compare the effects of Nos. 150 and 152, hung side by side. In the latter we have a view which has not only some charm of tone, but a favourable emphasis of a good bit of building design. In the former we have as dull a show as could have been produced. No. 191 is quite a picture, but No. 151 does not, we are sure, suggest what is probably in its setting quite a pleasant little house. One of the most interesting frames is that of the interior of Hay's Wharf, which consists of daintily drawn view, sections, and elevations of Mr. Goodhart Rendel's designs. Amongst the more striking drawings are elevations of Kensington Cemetery Chapel, by Messrs. Knapp-Fisher, Powell and Russell (148); Messrs. Aston Webb and Son's excellent Malvern College Memorial Reading Room (202); the Ulster Parliament Hall, by Mr. Arnold Thornely (80); Messrs. Mewès and Davis' Westminster Bank (83); a street frontage, the extension of College of Surgeons, Mr. E. C. Frere (85); a charming grey drawing of a house by Mr. Hepworth (13); a good water-colour view of a house by Mr. W. T. Benslyn (15); two excellently tinted interiors (No. 52) of Church of St. Alphage, Hendon, by Messrs. Nicholas and Dixon-Spain, and No. 57, Gorton Church, by Mr. W. J. Tapper, A.R.A.; and a nicely toned interior of the staircase at Hay's Wharf, by Mr. H. Goodhart-Rendel. A good deal of domestic work is shown which would take long to particularise, but we may note a nicely proportioned cottage group (42) by Messrs. Powys and MacGregor; two good houses (38 and 40), by Mr. E. Guy Dawber, A.R.A.; No. 23, a good quiet garden front, by Messrs. Baillie Scott and Beresford; a bungalow at Leek (19), by Messrs. Longden and Venables; No. 100, a photograph of a house at Holmbury St. Mary, by Mr. Oliver Hill; 182, a very pleasing pair of cottages, by F. Frank Hawkes; and No. 180, Manor Cottage, by Messrs. Hornblower and Thorp.

Ecclesiastical work is not very strikingly represented. A little water-colour shows a characteristic Church at Hubli, Bombay, by Messrs. Lanchester, Lucas and Lodge. The list of others is as follows:—The First Church of Christ Scientist, Southport, by W. Braxton Sinclair (No. 3); Church of St. Michael and St. George, Castleton, and Church of St. Mary, Nunthorpe, by Messrs. Temple Moore and Moore (No. 8); St. Peter's Chapel, Horsham, by Mr. J. Ernest Franck (No. 12); Eton College Memorial Chapel, by Messrs. Wratten and Godfrey (No. 20); Church at Ruislip, by Mr. A. S. G. Butler (No. 21); Holy Trinity Church Hall, Hounslow, by Mr. Cyril A. Farey (No. 22); Eleventh Church of Christ Scientist, by Mr. Oswald P. Milne (No. 26); New Church, Beddington, by Mr. H. P. Burke Downing (No. 56) St. Columba's Church, Scarborough, by Messrs. Temple, Moore and Moore (No. 62); St. Dunstan's Church, Woking, by Messrs. E. Goldie and Son and G. R. G. Topham (No. 69); Straits Chinese Presbyterian Church, Singapore, by M C. T. Murray (No. 94); Parish C Methil, Fife, by Mr. R. Fairlie, A. (No. 105); St. Paul's Church, East H Mr. Chas. Spooner (No. 106); St. An Church, Walthamstow (Altar, etc. Messrs. Hoare and Wheeler (No. 107); Weigh House Church Reredos, by M E. Henderson (No. 119); Font Cover Mary's, Hadleigh, by Mr. Chas. S (No. 125); Church of St. George, Cros Major H. C. Corlette (No. 132); Chu the English Martyrs, Sparkhill, Birmi by Messrs. Sandy and Norris (No. Second Church of Christ Scientist, (by Sir John Burnet, R.A. and Partner 140 and 142); Church of St. John, Ro by Messrs. Sandy and Norris (No. Church of St. Paul, Ashby, by Majo lette (No. 178); St. Michael's Church screen, Camberley, by Mr. E. E. B. C (No. 184); Eleventh Church of Christ tist (interior by Mr. Oswald P. Milne 185); Church of St. Francis, Barry, T. Alwyn Lloyd (No. 186); Second Ch Christ Scientist (rostrum and screen), John Burnet and Partners (Nos. 187 an St. Andrew's Church, Ilford, by Sir H Baker, A.R.A. (No. 189); Holy Church Hall, Hounslow, by Mr. C Farey (No. 191).

Of other subjects, a good photograph the new entrance hall (Merchant Tayl Sir Reginald Blomfield, R.A.—a pleasa nified piece. Sir Reginald's other co tion shows the Rest House for mi Hucknall, a very nicely proportioned b as seen through the entrance gates. G. Newton is fortunate in his photog the upper level of the Marlborough Memorial Hall, which has an agreeabl of space and dignity. There are sever exhibits grouped round here—the e church by Major Corlette, a good, d bit from the Friends' House in Eustor by Mr. H. Lidbetter, and the new Fore Gallery at Millbank, by Messrs. R Walker and Jenkins; Messrs. Adshe Ramsey's Worthing Pier Pavilion (is shown in a thin water-colour which hardly does justice to the this is certainly a point of view will be obtained, but if it is it surely might be more pleasant ployed. An effective photograph shows a good result in an altered ol by Messrs. Hayward and Maynard. sparkling photographs of the Unive Al il Beit, Bagdad, by Mr. J. M. suggest a clever treatment of an orien ject. The new College rooms for Christi, Oxford, promise well—a goo water-colour view; and the same may of a little chapel at Horsham (No. 12 Ernest Franck.

OBITUARY

Mr. Frederick Ernest Crutchley, A.

It is with regret that we record th of Mr. Frederick Ernest Cr A.R.I.B.A., who died early on T morning of last week in Charing Cr pital, after a fall from premises in Street, Piccadilly, the day before Crutchley, who was 38 years of age, ing school worked during 1905 un Taliesin Rees, and then for the ne years took the architectural certifica at Liverpool University, obtaining a certificate. From 1909 to 1911, he w assistant to Messrs. Adams and Hold ing them to take up a post with Mr. Flockhart, from whom he went, to Messrs. Wimperis, Simpson and In the years 1911-1913, he attended classes at the University of London. been described by one who knew h careful and painstaking draughtsma man of great personal charm of man was admitted an Associate of the in 1920.

Mr. Frank T. Verity, F.R.I.B.A., Architect.

AMERICAN APARTMENT HOUSES.—XVI

By F. E. BENNETT, A.R.I.B.A.

The transient condition which pertains to American life also pertains to buildings. Works which last more than fifty years are often unnecessary and sometimes unwanted. If a building functions for 20 years in the capacity for which it was built, the owners are reasonably satisfied. The problem is to construct so that the building may be readily changed for use in another way.

Certain fundamental conditions have an important bearing on plans. Daylight in New York is more intense, owing to the greater elevation of the sun; shadows cast by buildings are not so long; the atmosphere is much drier than in England, and it is comparatively free from smoke. As a result, corridors and internal lobbies, lighted only by borrowed lights, are tolerated, and the absence of ventilating lobbies to the bathrooms and toilettes is not considered objectionable.

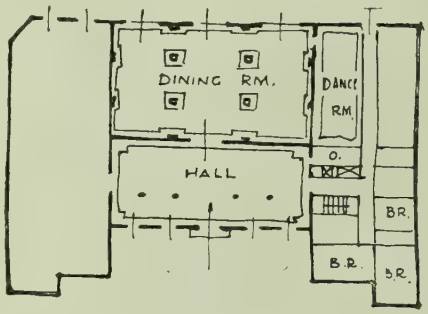
The standard of living is another factor reflected in the planning. Generally speaking, this standard can be said to be twice as high as that of Europe. This fact and the dryness of the atmosphere account for the greater demand for bathrooms than in England. For the same reasons, among others, the highest floors of an apartment building are considered more desirable than the lower ones. Ideas of natural lighting, ventilation, heating, equipment of the kitchen and food storage, again differ from the English ideas mainly because of the difference of climate.

Owing to the similarity of buildings and the concise building laws, the method by which plans are worked out is much the same. Starting, in the first place, with this idea assumed, I particularly asked architects the question, "How do you approach the problem of planning a typical floor?" Some architects were not quite sure how they did it, but some, on the other hand, were quite certain. From the notes I made I was able to arrive at an average method adopted. This is it:—

Planning the Typical Floor.

1. Consider the locality and the kind of accommodation required.
2. Roughly determine the number of rooms per lot of 25 ft. by 100 ft. Average is 5½; maximum, 7.
3. Lay down the shape of the block. The factors which decide the main outline of this block are:—
   (*a*) Height of the building.
   (*b*) Location and size of yards and courts.
   (*c*) Location of building plot—either on corner of a street and avenue or an inside lot on the street.
4. Determine the number of flats and their rough division.
5. Divide each flat into three portions—living, sleeping and service—so that each one communicates with the other two.
6. Lay down stairways. Each apartment must have two stairway exits—one with natural light. It is economical to have the other with natural light also.
7. Lay down lifts.
8. Lay down kitchens.
9. Lay down dining-rooms. (They are least important for daylight.)
10. Lay down living-rooms.
11. Lay down bedrooms. Give them south aspect as far as possible.
12. Lay down baths, pantries, foyers, maids' rooms, etc. Maids' portion of the house must have complete separation from the masters'.
13. The steelwork design comes after the planning. Just put the stanchions in the corners of the rooms.
14. Make alternative plans and compare total floor space provided by each.
15. If the plan is an unsymmetrical shape, make the block plan symmetrical to the nearest actual form, design the apartments, and then twist the whole thing back to the original block plan.

A plan largely depends on the disposition of lifts, and the tendency is to place them together. A good plan for a large number of small flats is feasible if proper light can be obtained in the public hall leading from stairs and lift to these apartments. One lift should not serve more than four flats on one floor. A good plan, like every other kind of good plan, will always look simple and will need very little or no explanation. Difficulties in planning increase with the decrease in size of the flats and with the increase of the number of flats per floor. Rarely more than 75 per cent. of ground is ever covered on corner lots, as it is found beyond that the dark areas become excessive.



As a last note, I should like to draw attention to the Sheraton Apartment Hotel, Boston, Mass., which is illustrated this week. The architects are Messrs. Strickland, Blodget and Law, of Boston. Although this building is not a block of flats, but an apartment hotel, there are many points of value about it for the designer of flats to notice, and it is in many ways a very good example of the sort of thing, I think, we might reasonably have in England were t laws but revised to make it possible. T elevation and the interior decoration are e cellently designed, and the architec admitted their indebtedness to Mr. Ramse book, "Late Georgian Houses," in prepari them.

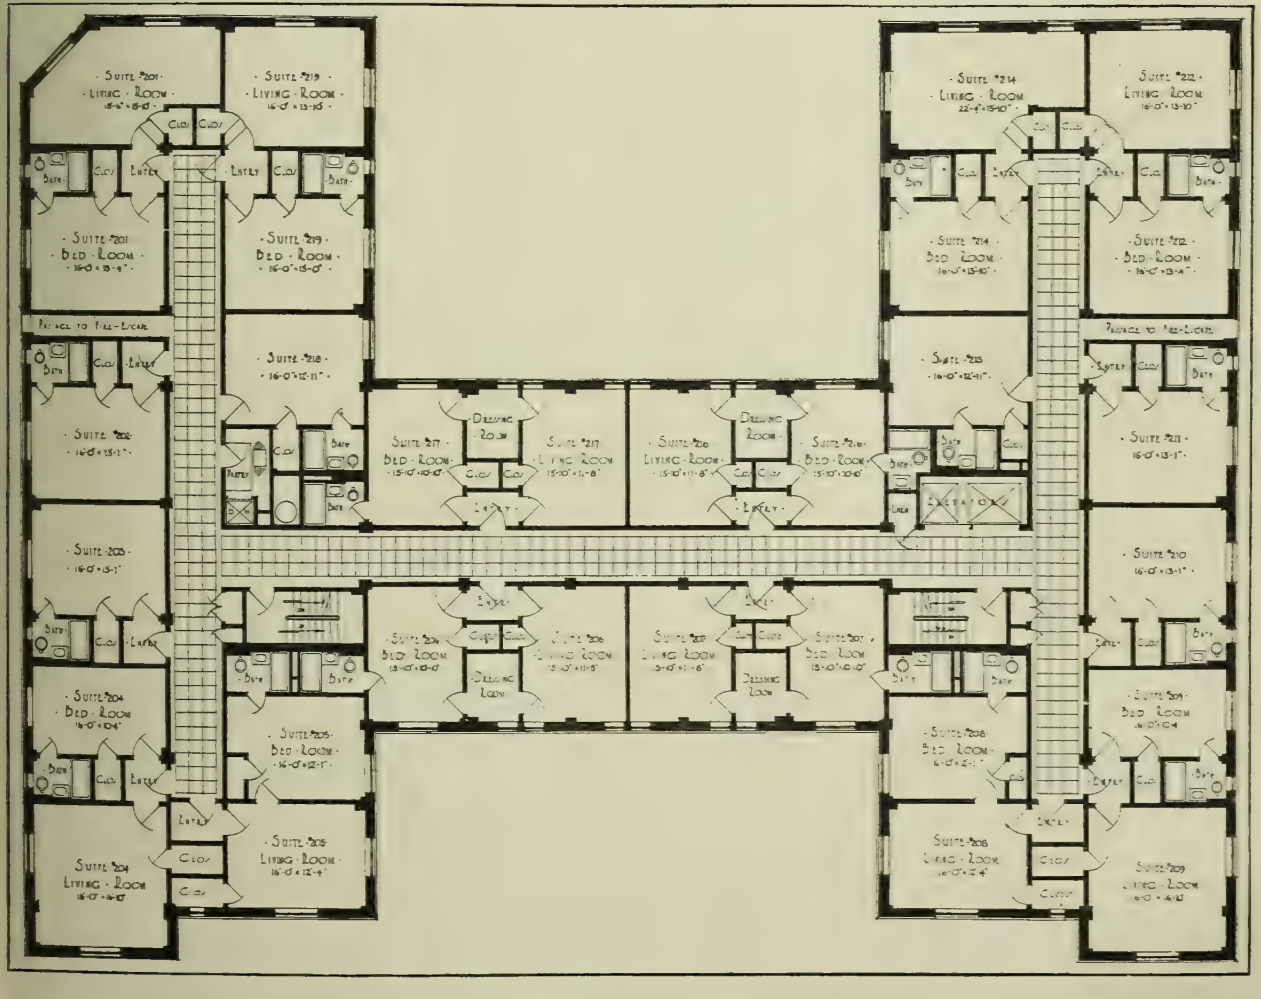
CORRESPONDENCE

[While we are glad to publish letters on professi and other matters of interest to our readers, it must understood that we do not necessarily endorse the rema of correspondents, who will oblige us if they will expr their views as briefly as possible.]

Acquisition of Chiswick House and Groun



Sir,—I welcome the challenge which H. N. Sherwin-White, of Grove-park, valiantly published in your last issue, beca an opportunity is afforded me to furnish furt facts which will enable your readers to ju the rightness of the conclusions expressed my letter in "The Builder" of the 1st in It is true that nine years ago I did my b to frustrate the erection of vast gasworks on Duke's Meadows skirting the Thames. I not in the least desirous of seeing an elec city generating station added to the railw line and soapworks coming in the near futu on the other side. All factories are objecti able, but in this case the position has vas changed owing to the chance of obtaining Ch wick House and its splendid gardens. T site in question is incomparable, out of t way and relatively unimportant.

Your correspondent wonders what pois has inoculated me since I so successfully fou the Gas Company in 1918; moreover, my s gestions now, he says, are ludicrous. The f lowing particulars will conclusively show abortive scheme advocated by my crit backed by his Grove Park neighbours. Th seem to overlook the fact that residents the abouts only form a small part of the 50,(population of Chiswick. Their Barnes s porters, by way of the bridge can almost imm diately reach the sports grounds and play fields on the Duke's Meadows, whereas majority of Chiswick people have to trave long journey by bus or walk miles to en what they have paid for. The community Grove Park suffers from no such disabili being close by. The gardens and park-l grounds in which Chiswick House stands situated in the centre of the parish and, already explained, are readily reached from High-road.

No one for a moment supposes that Chisw can secure this magnificent property nothing. The position, briefly, is this: T Chiswick Council have an agreement with firm, the effect of which is that as rega 30 acres of the Duke's Meadows land, company is under contract on paying sum of £1,500 per acre as they take the la to remove the sand and gravel over a per of 15 years, and hand back the land to Council properly filled up with suitable ma rial, when it will be the Council's work lay out the land as playing-fields. The r agreement with the Electricity Autho provides for the authority taking their acres, subject to the existing agreement w the firm in question, which in effect me that the authority have to make terms w the firm in respect of about 30 acres wh overlap the electricity lands. On these te the Electricity Authority will hand o Chiswick House, as I have previou explained.

Mr. Sherwin-White contends, in accorda with the Barnes idea, that the Chisw Council are losing £45,000, that being sum they otherwise would have obtained a

The "Sheraton" Apartment Hotel, Boston, Mass.

MESSRS. STRICKLAND, BLODGET & LAW, Architects.

I

later date from the firm in respect to 30 acres. Those who argue thus say in effect: "Retain your land and get your £45,000, and Barnes, or some other body, possibly the county, will find the remaining £15,000 to buy Chiswick House." Barnes, however, does not appear to have yet made any such definite proposal, and in the meantime the purchase money has gone up to £65,000.

The fallacy of Mr. Sherwin-White's proposal is that while the £65,000 needed to secure Chiswick House is wanted at once, the £45,000 would arrive gradually over a period of twelve years, coming in deferred payments, totally ignoring meanwhile the question of the existing mortgage on the lands. This explanation amply justifies my letter ignoring this unworkable alternative previously discarded. My answer is that I described correctly the best solution of the problem as at present advised. The Chiswick Civic Association, among others, wrote to congratulate me upon my impartial communication published to support the Chiswick Council proposals and the wise intention to accept forthwith the Duke of Devonshire's preferential offer for the acquisition of Chiswick House and grounds. That alone is the object which I have in view, and the more the project is discussed the more unanimous will be the verdict in favour of the Council's programme.

MAURICE B. ADAMS.

Bedford Park, Chiswick, W.4.

Inferior Housing Design.

SIR,—Your editorial declaims against our inveterate civic untidiness—chiefly in the matter of hoardings and petrol pumps—and calls upon every architect to protest against these things, but how are such protests to be made effective? The mass of the people who constitute "public opinion" are quite indifferent, and the civic authorities are often themselves offenders.

It seems amazing, for instance, that a well-known country Corporation, possessing a rich architectural heritage, could be content to leave the design of its new houses to the tender mercies of any builder who would undertake to erect them at a low enough price, yet such is the case, and that is not all of the deplorable story. The local newspapers report that, being unable to secure suitable plans and tenders for more than a few out of the total number of houses required, the Town Council evolved designs which, upon being submitted to the Ministry of Health, failed to satisfy even the minimum standard of that Department, and were, in consequence, rejected.

If, as is urged, local authorities are vested with powers to adjudicate upon questions of design, what can be hoped for from those bodies which exhibit a lamentable failure to keep their own houses in order? This is a matter upon which you may well give a lead, for it seems hopeless to found Societies and pass Acts of Parliament to preserve picturesque old cottages if, for every one so preserved, dozens of vulgar, pretentious cottages are put up at the instance of those who should be concerned to raise and not debase the currency of architecture.

"LIRIBUS."

Peterborough Cathedral Restorations.

The Ecclesiastical Commissioners have promised to give another £1,000 to Peterborough Cathedral Restoration Fund, to be paid by instalments as the work proceeds.

New A.R.A.'s.

Mr. Henry Rushbury (engraver) and Mr. E. Guy Dawber (architect) have been elected Associates of the Royal Academy of Arts. Mr. Rushbury was born in 1889 at Harborne, near Birmingham, and is best known outside the range of connoisseurs by the drawings and paintings he did in war-time for the Imperial War Museum. An account of Mr. Guy Dawber's work and career is given in a note on page 674.

THE CARLTON THEATRE HAYMARKET

This theatre, which was opened on Wednesday last, and which we illustrate this week, is somewhat reminiscent in its foyer and lobbies of the work of the brothers Adam. The size of the site called for exceptional planning on the part of the architect, since vestibule, theatre, 49-foot stage and dressing-room block had all to be compressed into the site-depth. A feature of the theatre is that it has no gallery. There is a royal dress circle, and above it the balcony tier, at the back of which is a parterre. The seating in all parts is luxurious, and a perfect view on to the stage can be obtained from any seat in the house. There are slightly under 1,200 seats, all of which are centred to the centre of the stage. The acoustics of the theatre are well-nigh perfect, it being possible to converse in normal-speaking tones from the top seat of the balcony to the stage. A notable feature of this theatre is the ventilation. This has been carried out on a new system, the intakes being at the top and the exhausts being placed round the theatre at ground level. By this system it is possible, we believe, to control temperatures almost to a degree. There is also a most efficient refrigeration system. By means of these systems the normal temperatures and humidity may be maintained.

The stage lighting is novel and up to date. There is also a Schwabe cyclorama installation.

The decoration is rich, and designed for comfort. This is specially noticeable in the Royal Circle, where there are but four rows of seats—all deep and padded well-seats—with 3 ft. 6 in. space between each row, thus ensuring adequate leg-room. The general treatment of foyers and vestibule is in pale gold flecked with silver, and this is carried on in the auditorium, which is panelled in dark oak colouring, giving added warmth and intimacy. The seating is in maroon, which provides relief to the pale cream stage-opening. There is an attractive and yet unostentatious frieze round the theatre, while the electric light chandeliers, wall-lights, etc., are the work of various French designers.

The theatre, as a whole, is a notable achievement in the combination of comfort, style and utility. Mr. Frank T. Verity, F.R.I.B.A., is the architect, in association with Mr. S. Beverley. They have received the co-operation of Major C. H. Bell, O.B.E., consulting engineer. A tribute to Messrs. Arthur Vigor, Ltd., of 25, Knightsbridge, S.W.1, who carried out the general contract, is the fact that the theatre was built in the record time of 12 months. Among the principal sub-contracts were :—

Steelwork : Moreland Hayne and Co., Ltd.; Stone: Ham Hill and Doulting Stone Co.; Lifts: Waygood-Otis, Ltd.; Asphalte: F. Faldo and Co., Ltd.; Electrical Work: General Electric Co., Ltd., and Berkeley Electrical Engineering Co., Ltd.; Marble Work: Fenning and Co., Ltd.; Interior Decorations: G. Jackson and Sons, Ltd.; Metal Lathing: Expanded Metal Co., Ltd.; Wood Block Floors: Acmé Flooring and Paving Co., Ltd.; Concrete Staircases: F. Bradford and Co., Ltd.; Air Conditioning: Carrier Engineering Co., Ltd.; Fire Sprinklers: Mather and Platt, Ltd.; Vacuum Cleaners: Sturtevant Engineering Co., Ltd.; Furnishing: Waring and Gillow, Ltd.; Ironwork: Comyn, Ching and Co., Ltd.; Heating: Young, Austen and Young.

A War Memorial.

The unveiling and dedication of Messrs. Waygood-Otis's, Ltd., memorial to those of their employees who gave their lives in the Great War, took place at their Falmouth-road works on April 2. The dedication service was conducted by the Lord Bishop of Woolwich.

MEETINGS

FRIDAY, *April* 29.

Town Planning Institute.—Professor S. Adshead on "Replanning Bloomsbury" 6 p.m.

Royal Sanitary Institute.—Discussion "The Housing (Rural Workers) Act," Messrs. C. E. Tangye, H. B. Mapleton, a A. J. Redfern. At Guildhall, Exet 2 p.m.

SATURDAY, *April* 30.

Institution of Structural Engineers (Sou Western Counties Branch). — Annu General Meeting, Dinner and Dance, Devonport.

London Society.—Visit to Foyle's Bo Stores, 121, Charing Cross-road, W.C 2.30 p.m.

MONDAY, *May* 2.

Royal Society of Arts.—Mr. J. W. Walsh on "Measurement of Light (2) 8 p.m.

TUESDAY, *May* 3.

Institution of Civil Engineers.—Mr. Forrest on "Some Recent Services Metallurgy to Engineering." 6 p.m.

WEDNESDAY, *May* 4.

Association of Architects, Surveyors a Technical Assistants.—Visit to Mess: Walker and Parker's Lead Mills, 63, B vedere-road, S.E. 6.30 p.m.

Institution of Sanitary Engineers.—M F. Wilkinson on "House Refuse Collecti and Disposal." 6 p.m.

Builders' Clerks' Benevolent Institutio —Annual Dinner at King's Hall, Holbo Restaurant, W.C. 6.30 p.m.

THURSDAY, *May* 5.

National Housing and Town Planni Council.—Annual Conferences of Lo Authorities in England and Wales. Town Hall, Leeds. 11 a.m.

FRIDAY, *May* 6.

Institution of Structural Engineers Joint Meeting with the Societe Ingenieurs Civils de France. Monsieur Trocquer, Past Minister for Public Wo (France), on "Engineering Features of Channel Tunnel." (In French.) 6 p.m.

London Society.—Annual Dinner, at Ho Victoria, Northumberland-avenue, W.C 7.45 p.m.

April 29; *May* 3 *and* 5.

University of London.—Professor J. Vogel on "Development of Ornament Indian Art." At School of Orien Studies, Finsbury-circus, E.C.2. 5.30 p

GARDEN CITIES AND TOWN-PLANNI ASSOCIATION.

Members of the Garden Cities and To Planning Association, now on a tour in South of England, visited Southampton Monday last. In the morning local hous schemes were inspected, and on Wednesda tour was made of the Southampton Docks the site of the proposed extension works by invitation of Mr. G. R. Newcombe, the dep docks and marine manager of the South Railway. On Monday evening a discussion the "Commercial Development of the Ha shire Coast" was opened by Mr. B. Townroe, who stated that the Southern R way had made Southampton a great port a national asset. A docks extension and reclamation scheme was now being carr out at an estimated cost of over £13,000.(These extensions of the western shores mi well revolutionise the coast of Hampshire, would inevitably bring about considerable dustrial developments. Southampton was ticularly rich in the beauty of its surroundir and that the Corporation and the local C Society recognised that wise planning essential. Among the questions that had be considered was the control of the grow industrial area. By proper planning the factories and warehouses could be so pla that they would be convenient to the do The mistakes made in London, where ev day innumerable lorries carried raw mater from the docks to factories miles away, m well be avoided.

ILLUSTRATIONS

St. John's Church, Rochdale, Lancs.

is church stands in an open site immely opposite Rochdale Station, on one r of the main square. The general contion is of concrete stanchions carried dly up from the massed foundations under four piers supporting the dome. These hions form a monolithic mass over the span of the dome, which is carried on four entives. The thickness of the dome at the is 4½ in. only, increasing to 5 in. at the ch. The building is faced with local ed brick, small size, with white mortar ing and Empire Portland stone dress- The structural part of the work was ed out under the supervision of Mr. G. ard Geen, A.M.Inst.C.E., of London, also acted in the capacity of consultant neer for this portion of the work. The cost of the building was just over 000, which represents a very low cost cubic foot.

e architect responsible for the design erection of the work was Mr. E. Bower is, F.R.I.B.A., of the firm of Messrs. Hill, y and Norris, of London, Stafford and chester.

e general contractors for the site work, dations, brickwork and general finish- were Messrs. R. and T. Howarth, of dale, and the following were sub-conors :—Couzens and Akers, Ltd., Birham, heating; H. Pratt, Ltd., Birming- electric light; Jos. F. Ebner, wood floors; J. H. Walker, West Bromwich, ed lights and stained glass windows; J. Gibbons, Wolverhampton, door furniture, boundary railings, etc.; the Empire Store Co., London, stone dressings; J. Ashton-Floyd, Manchester, architectural carving.

New Infirmary, Billericay Union Workhouse : Site and Drainage Plan.

Temple Bar Telephone Exchange.

This building stands on a site in a part of Russell-street, Covent-garden, which is so situated that an obtuse bend occurs in an awkward position in the frontage. The building has been designed to include shops for letting, and has a certain amount of space on the upper floors which is surplus to immediate requirements, but will be let for the present. The treatment of the elevation in four similar groups of windows having the central window in each group emphasised by flanking columns on corbels—one such group being on one side of the bend and the other three on the other—developed from considerations as to the form of frontage and the narrowness of the street.

The general contractors were Messrs. A. Roberts & Co., Ltd., 74, Earl's Court-road, W.8, who completed the job, we understand, in three months under contract time. The materials used are red bricks supplied by Messrs. S. E. Collier, Ltd., Reading, the bricks being of the narrow form, built five courses to the foot, combined with Portland stone worked by Mr. C. W. Courtney, of Putney Bridge. The steel casements were supplied by Messrs. Williams & Williams, of Chester, and the cast-iron balconies and gate to the yard entrance by the Birmingham Guild, Ltd. The steel frame was carried out by Messrs. Dorman Long & Co.

The architect was Mr. John H. Markham, F.R.I.B.A., of H.M. Office of Works.

Other Illustrations.

We publish this week reproductions of a number of the exhibits at the R.I.B.A. Exhibition of Modern British Architecture, now being held at 9, Conduit-street, of which a notice is given on page 678. The subjects include "Stowell Hill," a characteristic house by Mr. E. Guy Dawber, A.R.A., P.R.I.B.A.; St. Andrew's Church, Ilford, by Sir Herbert Baker, A.R.A.; and some illustrations of models, given on our Notes pages. We also include some subjects from the Royal Scottish Academy Exhibition.

The Carlton Theatre.

A description of this new theatre, of which Mr. Frank T. Verity, F.R.I.B.A., is the architect, is given on page 682.

RCHITECTURE AT THE ROYAL SCOTTISH ACADEMY

By BENVENUTO BRUNELLESCHI.

othing great or true in building to have been invented in the sense lfully designed. Beauty seems to be t as happiness to conduct—it should by the way, it will not yield itself rect attacks."—Lethaby.

eauty is not a question of taste, but ertainable fact."—Sir Edwin Lutyens.

itus considered that "Morality, and se moves in a circle." This is in a true of architecture, and the begin- and end of the circle might be termed principles. Post war economies have d this age back to first principles, and dly there are signs that our national tecture is rising to a purer and higher through adversity. We hear much among laymen of the decadence of the tecture and art of our age, but is the in keeping in touch with the modern tion as expressed in the finest works r age? Does he realise that we have thedral, one third of which is already which will exceed St. Paul's, by one in area, and will be the fourth largest h in the world when it is finished? he examined and considered our great ess premises and stores which rival andeur and design the great works of n and Renaissance times?

e place of honour in the architectural at the Royal Scottish Academy is this year to Messrs. Sir John Burnet, am, Anderson, Probst and White's ing of the central entrance to Messrs. idge and Co.'s premises in Oxford t, London. This fine drawing by Gordon Holt dwarfs everything else in oom. The drawing is 7 ft. 6 in. long ft. high, and is to a scale of eight feet he inch. The design, of a typical etesque Renaissance type, shows a age to Oxford Street of over 500 ft., a roof line about 115 ft. above street The centre block rises to a height out 160 ft., and from this block a tower, over 50 ft. square, rises to a t of over 400 ft. A Composite Renais- order runs through the first, second third floors, and is about 40 ft. high. fourth floor is contained in the en- ture. The fifth and sixth floors are ack with roof garden in front. The n is symmetrical on the vertical axis. the scale is well preserved throughout vhole composition.

lging by this design one might be ed for thinking that this is indeed the n age of commerce. While eclectic in l the composition and arrangement of is essentially modern. The archi- are to be congratulated on their fear- handling of big stuff, and Mr. Gordon has done full justice to the design is thoroughly realised draughtsman- and his skilful handling of the sepia chrome washes in which the drawing ndered. It is unlikely that the great will ever be built, and in any case doubtful if it in any way expresses the of the building. It suggests rather town hall of a great Renaissance The tower is finished with a pyramid roof which supports a quadriga o. At a height of 400 ft. would this ise or effective? The upper stage of ower is surrounded by an Ionic colon- and figures. Would these figures be uch value at this height? There is sculpture throughout the design h is happily placed, and adds much e beauty and completeness of the work. truly a great achievement, and ranks as a sample of modern commercial tecture

erpool Cathedral, by Sir Giles Gilbert , is illustrated by three drawings; ex- r view showing proposed tower; ior, view of choir; and exterior, show- ing completed scheme. In these three drawings Mr. T. Raffles Davison, with all his usual care and fidelity, gives us a realistic representation of what has been done and what is yet to do. The first two drawings are in pen tinted work, and the general view in pen and wash. This great cathedral marks a new phase in the ecclesiastical work of this country, and when we remember that Sir Giles won this commission in open competition at the age of 21, we need hear no further talk of the decadence of the architecture of our time. 70 years of Gothic revivals preceded it, and these 70 years were not wasted if they prepared the way for this masterpiece. In Liverpool Cathedral we see Gothic set out on Classic lines. It differs entirely from all past Gothic work in that it does not present that multitude of flying buttresses and pinnacles with which most mediæval examples are adorned. Like Lincoln it stands high and clear above the town and in the simplicity of its mass it possesses an almost classic-like appearance. Its importance in the religious life of the country may be realised when it is remembered that since the Reformation only two other cathedrals have been built for the Anglican Church. It is in no sense mere imitative Gothic either in orientation, plan or detail, but in it we seem to find that unity between architecture and the crafts which made mediæval times so notable, and without which nothing truly great can be achieved. Added to this the words of Mr. Manning Robertson may explain the rest. "The Gothic impulse is not to be recaptured by fakes of mediæval details; it is found again in personal contribution to the glory of God in the spirit of devotion." Liverpool Cathedral differs from mediæval churches mainly in this that the west front will not be the most important feature, but the great entrance porches on either side under the great tower. It will be 619 ft. long and 197 ft. wide when completed, and the central tower will rise to a height of over 300 ft. It will be an achievement without parallel in the history of architecture if this great building is completed in the lifetime of the designer.

Sir Robert Lorimer shows many of the full-sized cartoons for stone carving and bronze work for the Scottish National War Memorial. These drawings further dwarf everything in the architectural room. It is somewhat unfortunate that there is no scale drawing of the Memorial showing the relative position of these various details. Seven cartoons in charcoal, designed for carved stone panels, give allegorical representations of Saturn, Mercury, Venus, the Sun, Moon, Jupiter,

From the Royal Scottish Academy Exhibition.

Building Designed for the Mathematical Department of the Einstein Institute, University of Jerusalem.

By Mr. F. C. Mears, with Professor Patrick Geddes and Mr. B. Chaikin, F.R.I.B.A.

and Mars. The figures are composed in masterly lines and super-imposed on a circular background. They are obviously designed for stone carving, and at a height their simple and vigorous lines should be most effective. They were designed and drawn by Dr. D. Strachan. The five large cartoons by Mr. Morris Meredith Williams show a continuous frieze of modern soldiers with a wreath panel in the centre composed of thorn and laurel and a vertical sword. These are to be reproduced in bronze. All branches of the fighting and auxiliary forces are shown with aeroplane, tank, machine guns and other implements of war. Nurses and V.A.D.s mingle with the procession.

Although lacking the joyous rhythm of the work of Donatello, there is great skill and accomplishment shown in the arrangement and disposition of this multitude of figures, and in the bronze it will gain much by being rendered in terms of planes instead of outline. The realistic representation of modern figures in sculpture and decoration is now being achieved with considerable success by some of our best sculptors, and from a historical point of view must be allowed as justifiable. Obviously such work, if properly carried out, expresses the history and spirit of our own time in a way that no mere symbolic or allegorical work could do. Mr. Meredith Williams is to be congratulated on the unity and interest he has achieved in solving this most difficult problem.

The Bank of England reconstruction by Sir Herbert Baker is illustrated by a water-colour by Mr. P. Hepworth, which is artistic but somewhat sketchy. The difficulties of this problem of reconstruction are apparent in the somewhat detached condition of the circular composite portico at the angle of the building. The upper floors are set back on both fronts in a manner which gives a lack of unity to the design. No plan is shown, but we may assume that this treatment has been necessary to provide sufficient light for the ground floor.

Devonshire House is illustrated by a clever crayon drawing by Mr. J. D. M. Harvey. Messrs. T. Hastings and C. H. Reilly, the architects, seem to have been influenced to some extent by modern American types. The general effect is massive and scholarly.

Mr. James R. Millar shows a water-colour of dining-halls and open-air tea-garden at Bournville, a simple and finely proportioned building in red brick. The general lay-out, with pavilions, is interesting. The drawing by Mr. Cyril A. Farey is in his usual clean, business-like, and distinctive manner.

Mr. Curtis Green shows a perspective of his branch Bank of South America at Bahia. An angle Ionic order runs through the first and second floor. The order seems somewhat heavy to carry nothing but the entablature over.

Messrs. Keppie and Henderson are represented by a design for a new building at Glasgow Cross. A simple and effective Renaissance treatment, with an Ionic order running through the second and third story of the circular angle treatment, surmounted by a dome. This fine pen drawing is unsigned, but is somewhat like the work of Mr. Macgibbon.

The new church, Riddrie, for the Parish of St. Enoch, Hogganfield, is another exhibit by the same firm. The church is solidly designed, with interesting tracery. The composition of the entrance front is interesting. The tower, with small lead spire, is detached from the main block somewhat after the manner of certain churches in East Anglia.

Sir Robert Lorimer shows plan, elevations and sections of the alterations and additions to Castle Fraser, a typical Aberdeenshire castle, with large round tower and buildings surrounding a courtyard.

Mr. H. O. Tarbolton shows photographs of the Chapel of the Resurrection, Old St. Paul's Episcopal Church, Edinburgh, and details of carved screen woodwork from St. John's Episcopal Church, Greenock. In the former the stone tracery seems rather large in scale, but the calvary is a fine piece of work by Mr. Alfred F. Hardiman. The woodwork in the latter is finely designed and notable in craftsmanship.

"Fullarton" and "Overburn," at Colinton, are two small country houses by Mr. M. M. Ochterlony. They are cleverly planned, and are illustrated by two dainty pen perspectives. "Balmadies," also at Colinton, is a larger country house by Mr M. M. Ochterlony. It is Scotch in type and nicely grouped.

The Institute of Mathematics at the University of Jerusalem, by Mr. F. C. Mears, is illustrated by a delicate water-colour. It is somewhat Romanesque in feeling, and shows Mr. Mears' originality in the handling of detail.

Sir Herbert Baker shows his Memorial to Indian Missing at Neuve Chapelle. The plan shows a flattened circle with two pavilions on the main axis and a column. The names of the missing are place the inside of half the circle, while front half is of open stone trellis wo

Mr. A. N. Paterson shows his design the roundels in coloured cement at Aquarium of the Edinburgh Zoo. The cleverly designed and good colour, but gest rather mosaic or cloisonné than ce

The Red Lion Inn, by Mr. T. Ai Swan, shows a country inn at Dalk The ground story is of stone and the story harled. With modern design Swan has caught something of the q mediæval quality, and it is altogeth happy treatment of a street corner. lion in red cement in the gable is tinctive, and the wrought-iron sign ad the charm of the whole.

Mr. Marshall Mackenzie shows a p perspective of King's College Hall at deen University. The drawing is some feeble, though conscientious, and does do justice to the design.

Mr. C. D. Carus Wilson shows a p graph of his City of Sheffield War M rial. It is of the pedestal and pole

From the Royal Scottish Academy Exhibition.

Organ Screen, First Church of Christ Scientist, Edinburgh.

MR. FRANK C. MEARS, Architect.

pedestal is octagonal, with swags and lds of a Renaissance type. Four bronze iers with reversed arms stand above pedestal, which is surmounted by a pole with crown at the top.

Ir. James M'Lachlan shows the accepted gn for new church for Morningside gregationalists at Edinburgh. It is strated by plan, elevations, and sections pencil and daintily coloured. The de- is of a Romanesque type, with a small, ewhat Italian-like belfry. It is a clever scholarly treatment of a problem where has been the usual troublesome factor. t. David's U.F. Church at Kirkintilloch, strated by photographs, is by Messrs. ey Waddell, and Young. The chancel ns overlit and the tracery rather heavy, le the roof treatment is too light in e for the rest of the detail. Most lern Gothic suffers from the lack of ney to carry out the roof as it should done with heavy principles or single or ble hammer-beams. This exhibit we in the Royal Glasgow Institute last r.

he extension to Monkton Parish Church the same firm suffers to some extent by scale of the detail being somewhat large the general scale of the interior. In e cases this defect leads to a quaint ginality, but it is always a risky experi- nt when dealing with otherwise pure les.

Miss Margaret Chilton shows a scale draw- of a double lancet window from the estory of the U.F. Church at Fountain- -road, Edinburgh. It is well composed, mirable in colour, and the figures are ated with Miss Chilton's usual facile terity. She also shows a full-sized oured cartoon for medallion window in Leonard's Church, St. Andrews, which real stained glass in treatment and ries with great effect.

Mr. John R. Sutherland shows a huge wing of the pedigree of Swinton of that dating back to 1336. It is a careful and orious piece of work carried out with at success, and shows Mr. Sutherland's le and comprehensive knowledge of aldry.

Mr. Frank Mears, in a photograph, shows organ screen for the First Church of rist. Scientist, Edinburgh. In it Mr. rs has successfully combined Romanesque l Gothic motifs, preserving the scale and ance in a most charming manner. The ttish Veterans' Cottages at Callander otographs), by Messrs. Stewart and erson, is a fine group based on good ttish domestic lines, and shows this firm's derstanding of the best in national work this kind.

Mr. C. d'O. P. Jackson, sculptor, shows a up of memorial panels, all exhibiting the ndness of his craftsmanship.

Mr. T. A. Swan, in his "Rockfield," he Dingle," and "Dalveen," shows three tographs of small country houses at vidson's Mains, Edinburgh, cleverly com- ed and admirable in treatment. Miss rgaret Chilton, in her scale drawing of lancet windows for Mayfield Parish rch, Edinburgh, combines figure work and aldry most successfully. The scale and ur are excellent. Mr. James A. Morris ws a table-topped tomb of the early 18th tury type. The carving and lettering are ly executed by Mr. A. Carrick.

Mr. C. D. Carus Wilson shows a model a Cenotaph, with an altar table in front, sarcophagus on top. The long vertical s of the composition rather break up simplicity of the design. Two winged res with swords stand at each end of altar table. While scholarly in detail, lacks religious inspiration. A memorial ne in granite by Dr. Douglas Strachan the memory of his father and mother is able for the vigour, simplicity and direct- s of its design and execution. The sub- , which seems to be the Adoration of the gs, seems rather unusual for a private morial. The Virgin and Child are seated the right with three figures, one kneeling and two standing on the left in an attitude of adoration. The modern-like floral canopy which is too large in scale, detracts from the dignity and beauty of an otherwise charming composition. Mr. F. W. Hardie, the sculptor, is to be congratulated on the great feeling and sureness of touch with which he has carried out this piece of work. It is a little gem in the completeness of its execution and feeling.

Mr. J. A. O. Allan shows a bird's-eye watercolour of the Intermediate School at Torry, Aberdeen. It is a one-story building of the latest type of school planning, and shows his cleverness in handling such problems.

Mr. Andrew A. MacCulloch shows a careful pen drawing of detail of stone balcony at Moray House, Cannongate, Edinburgh (1618-28), a typical example of the work of that period in Edinburgh.

Mr. R. Cantley Robertson's design for stained glass of "The Carrying Away to the Tomb" is well designed and harmonious in colour.

Mr. Leslie G. Thomson shows a crayon drawing of the front elevation of a small house at Colinton of the modern suburban type.

It is to be regretted that Sir George Washington Browne, the president, is unrepresented. Mr. John Kinross, Dr. Kelly, Mr. J. B. Dunn, and Reginald Fairlie, members and associates of the Academy, are also unrepresented. We miss also several other regular exhibitors. Whatever the reason, it seems unfortunate that the annual Scottish exhibition should have to depend so largely from contributions from the South. Scottish architects have played their part well in contributing to the evolution of British architecture, and there are many notable young designers and draughtsmen in Scotland. It would be well if the Royal Scottish Academy would devise some method for encouraging these men to work for and support the annual show of the Academy. With men like Burnet and Lorimer in the van, Scotland need not fear the future of architecture.

This exhibition proves that, given sufficient money, modern architects can hold their own with the work of the past. True, education has reduced most things to-day to a matter of intellectual adroitness, but here and there we find distinct evidence of true inspiration and a real understanding of the fact that mere utility is not the end of the architect's business. The vision of beauty for ever gleams on the horizon.

The following notes apply to two of the subjects reproduced with this article.

Building designed for the Mathematical Department of the Einstein Institute, University of Jerusalem.—This design follows Palestinian tradition, and makes use of the hard local limestones which may be had in a variety of colours. The buildings are to stand on the crest of Mount Scopus, northward from the Mount of Olives, and the arcade on the right affords a view towards the plateau of Moab and the trough of the Dead Sea, which lies some 4,000 ft. below the level of the site. The panel over the entrance doorway is based on a decorative development of the Pythagorean Theorem. The building has been designed by Mr. F. C. Mears in association with Prof. Patrick Geddes and Mr. B Chaikin, F.R.I.B.A., of Jerusalem.

Organ Screen in the First Church of Christ Scientist, Edinburgh.—This screen has been placed in a recess provided by Prof. Ramsay Traquair, who designed this church a few years before the war. The simple and spacious character of the interior called for a flat treatment which should suggest a screen rather than a case, and for the same reason large exposed pipes were avoided. The work was carried out in home-grown oak by Messrs. Nathaniel Grieve, and the carving was executed by Mr. T. Good, both of Edinburgh. The architect was Mr. F. C. Mears.

St Paul's Cathedral.

Mr. A. G. White, secretary of the National Federation of Building Trades Employers, has forwarded to Canon S. A. Alexander, treasurer of St. Paul's, a contribution to the Cathedral Preservation Fund of £485 12s. 2d., stating that the bulk of it comes from the North-Western district, where the Manchester members took up the matter with enthusiasm. A legacy of £500 has also been received by the fund under the will of the late Miss Frances Mead.

From the Royal Scottish Academy Exhibition.

The Red Lion Inn, Dalkeith.

Mr. T. Aikman Swan, A.R.I.B.A., Architect.

THE ARCHITECTURAL ASSOCIATION

Mr. J. Alan Slater, M.A., F.R.I.B.A. (President), occupied the chair at a meeting of the Architectural Association on Monday evening.

The minutes of the last meeting were confirmed. The nomination of one new member was announced, and Messrs. V. C. T. Hayes, M. Campbell Jones, I. H. L. King, and A. S. Killby were elected members.

House List, 1927-8.

The Council's proposed House List for the Session 1927-28 was then announced, as follows:—

President.—Mr. Gilbert H. Jenkins.

Vice-Presidents.—Messrs. W. H. Ansell, and F. Winton Newman.

Hon. Treasurer.—Mr. L. S. Sullivan, F.R.I.B.A.

Hon. Secretary.—Mr. O. P. Milne, F.R.I.B.A.

Hon. Librarian.—Mr. C. H. James, A.R.I.B.A.

Hon. Editor A.A. Journal.—Mr. A. H. Moberly, M.A., F.R.I.B.A.

Past President.—Mr. J. Alan Slater.

Ordinary Members of Council.—Messrs. L. H. Bucknell, A. S. G. Butler, G. R. Dawbarn, F. C. Eden, A. Trystan Edwards, Cyril A. Farey, W. R. F. Fisher, C. Lovett Gill, P. D. Hepworth, A. W. Kenyon, A. B. Knapp-Fisher, E. J. T. Lutyens, The Hon. H. A. Parkington, Lionel Pearson, S. C. Ramsey, T. S. Tait, C. S. White, G. G. Wornum.

Regional Planning.

Professor S. D. Adshead, F.R.I.B.A., then gave an address on regional and town planning, illustrated with lantern slides of diagrams and maps of a number of the most important schemes. In the course of his remarks, he said, in his opinion, the architects of this country did not take sufficient interest in town planning and less in regional planning. For some reason or other, it seemed so much easier for that kind of work to be carried out by the officials of local authorities, but it was probably merely an accident that architects were not more freely engaged on that kind of work. It should be the object of bodies such as the Royal Institute of British Architects and the Architectural Association to endeavour to get more closely associated with the great work that was being done at the present time of mapping the country into regions, and in planning those regions, as guides for the lesser and more intimate town-planning schemes that were rapidly becoming obligatory throughout England. He would like to dwell on the necessity for architectural assistance in the subject, for although architects were responsible for all that was above ground, the sites of housing schemes and public buildings were invariably decided by the engineers, who, quite rightly, made the roads and sewers and did all the work in connection with the sanitation and preliminary organisation in connection with town building.

The history of regional planning dated from the Public Health Act of 1875, which was the result of the rapid development of industrial towns on insanitary lines. Towns that developed under this Act had the characteristic that their outer fringes were all exactly alike, with street after street of straight rows of small houses, as at Salford, Wandsworth and elsewhere; the planning was all on the gridiron system, and all the houses were plain boxes with lids on. After forty years of this type of development it began to be realised that life was becoming very much standardised, with the result that there came about a complete change of method as exemplified in the early garden cities. The public then became interested in the subject of town planning, and places like Letchworth came into being. An endeavour was made to get towns to comply with natural conditions, and so the Town Planning Act of 1909 came into force. The general idea of that Act was to give greater variety and interest to small areas of development, to prevent standardised streets, and to get some of the interesting features and peculiarities of a district marked on the new method of planning. An endeavour was made to obtain a local communal interest. But before long it was found that these town planning schemes would not suffice without some broader control, as they were under the direction of many different local authorities, and would not always fit in with the development on right lines of larger areas. It was realised that the schemes were too small, and that something would have to be done to dovetail them together. It was for this reason that plans of a regional nature were being prepared.

Regional planning was of particular interest to industrial areas, such as the South Wales coalfields, which were intimately connected with Cardiff. Such a district was ideal for regional planning. It contained 20 or 30 local authorities, each of which would work in a disconnected manner unless there were a regional scheme covering the whole area, so that each individual local authority could see what would be best for the area as a whole and ensure that their separate schemes were related to each other. To-day there were 47 regional planning committees, each preparing plans for areas varying from 20 to 500 square miles. Altogether about one-fifth of the country was being regionally planned at the present time, or about 10,000 square miles. When the regional plans had been made the local authorities in the areas would combine as the executive authority for the whole of the region and make their statutory town plans.

It was found that industrial cities were not always situated in the best position for the kind of industry carried on in them, and this was largely because of the alteration in the source of power. Sheffield was a typical example. Sheffield commenced to grind knives because it had seven streams running through it. But as the city progressed, instead of using water power it took coal from Derbyshire and used steam. Cutlery was a light industry, but the introduction of steam power enabled Sheffield to deal with heavy steel industries, but it was not well situated for such work. In his opinion, the Chesterfield area would in the future take a great deal of the heavy industry from towns like Sheffield, because Chesterfield was better situated for carrying on heavy industry at the pit's mouth. Heavy industries would always go where there was coal, and lighter industries where there was a cheap supply of electricity. For 200 years it had been a question as to whether coal should go to iron or iron to coal, but the tendency nowadays was for iron always to go to coal.

To provide adequately for road transport great arterial roads were being made throughout the country. These roads had aroused a considerable amount of criticism from the general public, and bringing town-planning into disrepute where they passed through agricultural areas. But such criticisms were not fair, because these roads were not town planning, for town planning should not be injurious to anything that was of value, either economically or æsthetically, to the country. It was simply carelessness and ignorance that was causing so much damage in many areas. And it was a mistake to say that every wide road was ugly. In the first place these roads were either just completed or in the process of construction, and nothing looked more untidy than something in the making. They must be given a chance, for one would not be in a position to judge them for several years. There were parts of the new road from Dartford to Rochester, where the woodlands had been cut through, where really grand scenery had been revealed. In forty years' time many of the new wide arterial roads would be magnificent landscapes and a great inspiration to those who used them. But much more interest should be taken in the architectural set of these roads. So far as possible t should be direct, but there should alw be a feeling of submission to the natural f ures of the country.

In proposing a vote of thanks to lecturer, Mr. G. L. Pepler said quite a nun of regional plans had now be comple most of them illustrated with plans, m and diagrams. First and foremost purpose of regional planning was to see all land was put to its most productive in the interest in the community as a wh with due regard to health and ameni When one saw some of the uses to w unsuitable sites were put, one realised importance of the subject. The g advantage of the work of regional plan was that instead of things just happenin in the past, they now got bodies of together who were deliberating, with ex assistance, on the formation of a polic development. If they got no further i the awakening of a sense of responsib in the general public and members of l authorities they would have gone a way in the right direction. In the w of regional planning he did not think sphere of the architect was particul obvious, but there was no doubt the ar tectural point of view was of great portance; an architect had a habi envisaging all the needs of his client be he began to prepare plans, and that as essential in regional planning.

Dr. I. G. Gibbon seconded the mo and explained the necessity for thorou studying the sociological side of the prol if the best results were to be obta from town or regional planning. H ever well architects planned their hou schemes, with as many rounded or ob streets as they wished, they were in long run likely to prove futile or eve hindrance if the planner was not a stu of sociology who could with some degre accuracy discern the trend of future velopment. In all these schemes it unwise to attempt to start compl afresh; the best results were obtaine building on, or guiding rightly, exi development. Site planning was cl allied to town planning, and here thought was a fruitful field for the a tect. He thought the profession sh give much more attention to the que of site planning, of which some lament examples were to be seen in hou schemes and public buildings.

Mr. W. H. Ansell referred to the re case of the abandonment of a schem the Sevenoaks district following criticisms of local residents. He gested that, as a rule, too little atte was paid to local feelings, and that planners were apt to imagine they learnt all there was to know about a trict after passing through it in a m car at 30 miles an hour.

Mr. Harding Thompson said he ag that there was nothing more magni than a fine wide, straight road going thr rolling country, such as were to be see the Pas de Calais, but it had to be rem bered that in this island the landscape on a smaller scale, and such roads not so suitable.

Mr. Edward Unwin criticised the dency to make the new roads as lev possible by cuttings and other means. modern car, he said, had altered all of road transport, and now motor could easily travel up gradients of 1 at 30 miles an hour, there was no n sity for spending money on cutting avoid a gradient.

Mr. Gilbert Jenkins referred to remarks that had been made on archi and site planning, and pointed out th was a rare event for an architect to any voice in the matter of sites. Wh the design were submitted in compet or not, the site was invariably defi fixed before the architect was engage all, and in competitions any suggestion improving the site would rule out the petitor altogether.

LEGAL SECTION.

NOTES ON CURRENT CASES.

The Law Relating to Estate Agents.

must draw attention to a most import-ecision affecting Estate Agents in the case ppel *v.* Wheeler, reported in the current Reports (1927, 1 K.B. 577). The plain-as the owner of a block of flats, and on 28 he called upon the defendants and in-d them that he desired to sell the block ts for £6,500, but that probably he would t £6,000. The defendants had some time this valued the property at £7,000. On ing these instructions, the defendants d themselves in communication with a er of persons, amongst them being a Daniel, one of the tenants of the flats who lay 29 asked for particulars, but on that hey received an offer from a Mr. Essam rchase for £6,150 subject to contract. Atkins, a partner in the defendants' firm, this offer, which was in writing, to the tiff, who expressed satisfaction at the nt of the offer and the promptitude with it had been obtained and accepted "sub-to contract." This acceptance was put iting the same day, May 29, and on the day Mr. Essam wrote enclosing the de-by cheque and asking that the draft con-should be sent as soon as possible.

May 30 Mr. Atkins informed the tiff that he was sending copies of the offer cceptance to the respective solicitors, and he had received a cheque for £615, and efendants wrote to Mr. Essam accepting, ct to contract, the offer of £6,150, and also communicated with the plaintiff's tors informing them of the offer, and ac-nce subject to contract, and asking them rward the draft contract as soon as pos-

. Daniels, the tenant of one of the flats, om particulars had been sent on May 29, away from home and only found them on eturn on June 2, when he got into com-cation with the defendants and was in-d that the property had been sold "sub-o contract," but on June 3 he went to see Atkins and made an offer for £6,750. It re that complications begin. Mr. Atkins rently thinking that the plaintiff had lly contracted to sell the property did not unicate this offer to him, but telephoned r. Essam asking him if he would accept ofit of £600 on his deal. Finally, the was fixed at £6,950, a commission being d on. On June 8 the contract between plaintiff and Essam was signed, and on 20 the contract of sale by Essam to al was signed.

e plaintiff brought this action against the dants for breach of duty. He alleged that ne 8 (the date the contract was signed) hrough the agency of the defendants, d to sell the block of flats to Essam for 0—that before that date, namely on 2, the defendants had obtained from l an offer to buy the property for £6,950, id not disclose this offer to the plaintiff was their duty to do, but resold the pro-as agents of Essam to Daniel for £6,950, by the plaintiff lost £800, and he claimed sum with interest. The defendants coun-imed £149 15s., their commission on 0.

e Court below had held that all obligation e part of the defendants to find or en-ur to find another purchaser ceased on 30, when the plaintiff accepted the offer ject to contract," and allowed the de-nts to send the copy of the written ac-nce to Essam's solicitors, and judgment been entered for the defendants on the and counterclaim.

plaintiff appealed, and the Court of al has now laid down very clearly the principles that apply; but the Court was careful to state that the defendants had acted in perfect good faith in this matter, but under a misapprehension of their legal position. The position adopted by the defendants was that as soon as they had introduced Mr. Essam, who was a willing purchaser, and the plaintiff had accepted his offer, they had completed their obligation as agents and earned their commission, although the acceptance of the offer was "subject to contract."

The Court laid down that it was now plainly established that where a person accepts an offer subject to contract it means that the matter remains in negotiation (Chillingworth *v.* Esche (1924, 1 Ch. 97; *The Builder*, December 28, 1923), and this being so the duty of agents does not terminate until the contracts are exchanged between the parties. It was explained this did not mean that the agents were compelled to look out for other purchasers, for if the transaction goes through then they have earned their commission; but it does leave them under obligation to communicate to their principal any offer larger or more satisfactory, and various examples were given by the Court as to the duties owed by agents to the vendor, their principal, in this intervening period between acceptance "subject to contract," and the exchange of the final contracts. Different examples were given by the three members of the Court, but we quote the following passage from the judgment of Lord Justice Sargant: "To my mind it is quite clear as regards time that when agents are employed to find a purchaser for property their position as agents cannot definitely end at any time short (at the earliest) of the time when a definite binding contract is entered into and exchanged; and that if in the interval they receive information—whether, as in this case, from someone with whom they had originally communicated on behalf of their principal or from some outside source—which tends to show that the value of the property was greater than had been supposed, or is otherwise of a nature to influence materially the judgment of their principal in going on with or ceasing to go on with the contract which was being originally negotiated, they are bound to communicate that information to their principal, and if they do not do so they are guilty of a breach of their duty as agents."

The question of damages was left to the Court of Appeal, and the Court held that the damages were represented by the difference between the sum received by the plaintiff (£6,150) and Mr. Daniel's first offer (£6,750), that is £600. The Court further held that in a case like this, where the agents had acted in good faith but had made a bona-fide mistake, although that mistake amounted to a breach of duty for which they were liable in damages, this did not disentitle them from claiming commission, and the judgment of the Court below on the counterclaim must stand.

Landlord and Tenant: A Question as to Insurance.

An action of an unusual nature is reported in the case O-Cedar Limited *v.* Slough Trading Company, Limited (*Weekly Notes*, April 9). The plaintiffs were lessees of part of a building demised to them by the defendants for a term of 21 years at a rent of £3,700 per annum, and it was agreed that the plaintiffs should pay "as additional rent" an amount equal to that which the defendants might expend in insuring the premises against fire, and such amount was made recoverable by distress. By a covenant in the lease the lessees were not to carry on or permit upon the premises any noxious or offensive trade or business or to do or suffer anything which would render any increased or extra premium payable for the insurance of the demised premises or other premises adjacent thereto against fire, or which would make void or voidable any policy for such insurance. The lessors by covenant were to insure adequately and keep insured the demised premises against fire. The plaintiffs, acting as agents for the defendants, had effected insurances on the premises occupied by them and their contents at premiums averaging 3s. 5d. per cent., but on March 24, 1925, the defendants had let the remaining portion of the building to another tenant, a woodworker and maker of aeronautical parts and motor bodies, on a lease materially the same in its terms as that of the plaintiffs. In the following September, this having come to the knowledge of the assurers, they raised the rate for insurance to one guinea per cent. for the remainder of the currency of the policy, and refused after that to renew. The plaintiffs, after considerable trouble, effected insurances at 19s. 2d. per cent. It was found as a fact by the Court that this rise in premium was due to the letting of the remaining portion of the premises as a woodworking factory. This action was based on the alleged breach of an implied covenant by the landlord not to do anything to render an increased insurance premium payable in respect of the demised premises, and not to derogate from their grant, and the plaintiffs claimed the difference between the average premiums of 3s. 5d. and 19s. 2d.

The Court held that the action failed, for when a lessor put his lessee under an obligation not to use the demised premises in such a manner as to render an increased premium payable for insurance, it did not follow that the lessor was under a correlative obligation not to use the remainder of his land in the prohibited manner. But the Court pointed out that if the action of the defendants had rendered it commercially impossible to insure the premises at all, different considerations might have applied, but here the Court was being asked to extend the principle that a lessor must not derogate from his own grant beyond anything to which it had previously been applied. In this case the Court found that the lessors had only done something on their adjoining property not unreasonable in itself or unbusinesslike and which had not affected the demised property physically or rendered it less easy to carry on in the demised property the business for which it was demised, although it had rendered it more expensive to carry on the business.

Workmen's Compensation.

The case, Lewis *v.* Guest, Keen & Nettlefolds, Ltd., at present only briefly reported in the *Times* of April 9, appears one which should be immediately noted. A workman who had sustained injury by accident resulting in the loss of an arm in 1904 had subsequently been given light work by his employers and would have continued able to continue this work, but in September, 1924, owing to industrial conditions, the pit in which he worked had been closed down, and he made a claim for compensation. The arbitrator appears to have refused to award compensation on the ground that the employment would have terminated in any event. The Court of Appeal remitted the case to have compensation awarded, as the compensation relates to the incapacity of the workman from the effects of the accident and is calculated according to conditions in the normal labour market, but does not depend on abnormal circumstances. We draw attention to the case, as we understand other cases depend upon the decision, but we shall have occasion to refer to it again when the decisions given in the Court of Appeal are fully reported.

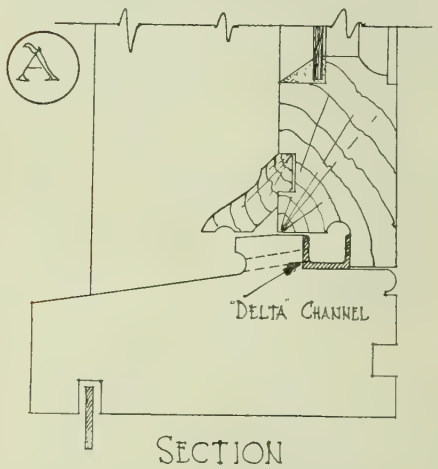
INQUIRY BUREAU

We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters.

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or, better still, in typewriting!—ED.

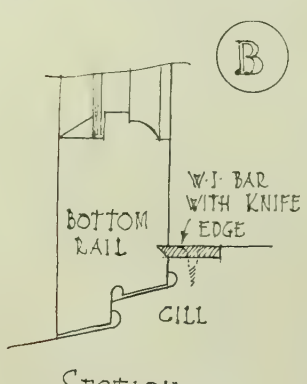
Diameter of Drainpipes.

SIR,—A proposed building has a roof area of 10,550 sq. ft., from which the surface water will discharge into two drains, one at each end of the building. Eighteen 3½-in. internal diameter R.W. pipes will carry the water from roof into the drains, so that each drain will have nine 3½-in. internal diameter pipes discharging into it. The length of each drain will be approximately 210 ft., with five manholes in each. The drains are connected at the fifth manhole, at which point another 4-in. diameter drain discharges matter from eight w.c.'s, eight lavatory basins and four urinal stalls; in addition, the drain will have to carry a certain amount of surface water from the ground about the building—from this point (fifth manhole) onwards one drainpipe will carry all the matter to the main sewer. I shall be extremely obliged if some experienced readers will give their opinions as to what internal diameter drain pipes should be used.



URGENT.

Rain-Excluding Device.



[REPLY TO "J. M.," APRIL 22.]

SIR,—The sketch "A" shows the construction that I have used with complete success for wood casements opening inwards, and these are the most difficult type to make weatherproof. Some years ago I had to deal with a number of casement windows to an exceptionally exposed building on the south coast. These opened outwards, and in spite of careful construction did not keep out the rain. The trouble was overcome by fitting to the frame some wrought-iron strips with edges bevelled and filed sharp so that they bit into the bottom rails and stiles of the casements as shown in sketch "B." It seems a rather brutal remedy, but it was certainly effective. The sharp edge of the iron bar makes its own groove, so that there is no doubt of its being a good fit.

L. E. WALKER.

Squash Racquets Court.

SIR,—Could any reader give the dimensions, marking, floor and wall materials, and other particulars for a squash racquets court, or reference to a publication containing this information?

"RECREATION."

Architects' Fees for Subsidy Houses.

SIR,—What are the general fees charged by architects for preparing plans and brief detailed specifications for subsidy houses? Generally supplying two copies on linen and two copies of the specification for and obtaining the approval of the local authority; also for supplying a copy of the specification and two blue prints to the client or builder. There is no supervision undertaken by the architect. Except for making a survey of the site, there are no ½-in. details or other drawings supplied.

SUBSIFEE.

BILLERICAY UNION NEW HOSPITAL

In the planning of these buildings the first consideration has been to place the wards so that they may obtain the maximum of sunshine and be as bright and cheerful as possible; a further influence has been the desire to keep down as far as practicable the permanent staff required to run the hospital and to avoid loss of energy. Consideration had also to be given to the fact that the hospital must be self-contained and capable of future extension.

The new buildings comprise three blocks:—(a) Administration block. (b) Operating theatre. (c) Main wing (the hospital). The administration block comprises accommodation for the doctor, sister, dispensary, drug store, nurses' dining room, sister's apartments, and maids' bedrooms. A kitchen with pantry, service, scullery, larders, store and a maids' dining room are provided, with in the basement a boiler house. The kitchen is fully equipped with gas cooking apparatus, consisting of ovens, boilers, steamer, hot plates, etc. In the roof space storage is provided for 2,000 gallons of water in four cisterns, 1,000 gallons for water from the mains of the Southend Waterworks Co. for cold services throughout the buildings, 1,000 gallons for storage of water from the mains of the Southend Waterworks Co. treated by a plant supplied by the United Water Softeners to reduce the action on the pipes of the hot water domestic services. The administration block is linked up with the main wing by a covered way, and centrally situated between the administrations block and the main wing is the operating theatre, containing anæsthetic room, sterilising room and the theatre.

The main wing provides for 70 beds, all on one floor level, divided into the following groups:—(a) Thirty-six beds for women, comprising: one ward for 18 beds, one ward for six beds, one ward for two beds, three wards for one bed each, labour ward, maternity ward for six beds. (b) Twenty-nine beds for men, comprising: one ward for 13 beds, one ward for six beds, one ward for two beds, three wards for one bed each.

In the centre of this wing is provided a sun ward for children with six beds and an open verandah attached. At the end of each of the 18-bed wards is a day room opening on to a glazed covered verandah, facing due south, with screened protection during inclement weather. A duty room is provided each made and female unit, with, in addition, the necessary stores, bath, slop sinks, sanitary annexes, etc. A staircase is situated in the centre of this block for future enlargement by a second floor, and to be used at the present for access to the roof for open-air treatment.

The elevations rely upon the texture of brickwork and the proportion of the wi openings to give a simple and dignified e and are of fireproof construction, with crete floors and roof, the latter covered asphalt. The floors of all wards corridors are of pitch pine with Carter skirting, and in the bath rooms, sani annexes, etc., the floors and dadoes ar the same material. The ward doors mahogany without panels or mouldings, in every way hygienic. The buildings heated by low pressure hot water, firep having been entirely eliminated in the wing, and the hot water domestic ser are supplied from calorifiers in the b house, all service mains being carrie ducts under the covered way and corridor. Duplicate boilers are provide each system, to guard against b down and to provide for perio cleaning, while provision has also made for future extensions. Arti light is provided by electricity generate the new engine house, which plant also vides light for the entire existing build The soil drains provide for future exten and are connected with the public sew Norsey-road. The rain water from all buildings is taken to an underground voir capable of holding 8,000 gallons, which the rain water is pumped by tricity to the laundry; provision is also so that the water in the existing well ad ing can also be pumped to the laundry. new buildings have necessitated ce alterations and additions to the exi buildings of the institution. A new e house has been erected providing accomm tion for the generating plant and batt and the laundry has been extended to vide additional machinery. At the entrance the existing buildings have converted to provide for a gatekeeper's and, adjoining, a mortuary and post-mo room are provided.

The general contractor was Mr. J. Go of Chelmsford, who carried out the v from the designs of Mr. Hugo R. L.R.I.B.A., of Brentwood. Mr. W. Rai was clerk of works.

The following sub-contractors were gaged upon the works:—Fawcett Constr Co., Ltd., concrete roofs; J. Weeks an (Chelsea), hot water, heating and don supplies; The Crittall Manufacturing Ltd., steel casements; Carter and Co., and mosaic floors, etc.; Rippers, Ltd., pital doors; Jos. F. Ebner, wood block ing; Ellis and Ward, electrical installa Benham and Sons, Ltd., cooking appa Sadgrove and Co., Ltd., furniture; Surgical Manufacturing Co., Ltd., su supplies; Nesbit and Evans, Ltd., bed bedding; James Hill and Co., ironmon The British Challenge Glazing Co., glazing.

Architect's Action for Balance of Fe

IN this case the defendant, Mr. A. F. appealed from a decision of the official r in favour of the plaintiff, Mr. Lidbetter, tect, on the question of fees due upon a Mr. Holman Gregory appeared for the app and Mr. Joy, K.C., for the respondent.

At the conclusion of the argument evidence Mr. Justice Salter said there wo judgment for the defendant on the claim the counter-claim as to responsibility m back to the official referee to be dealt with appeal would be allowed with costs.

Mr. Justice Acton concurred. A s execution with the view to an appeal was r

THE BUILDING TRADE

THE LAW OF FIXTURES.—I.

By W. T. CRESWELL, Barrister-at-Law; L.R.I.B.A.; Associate (late Fellow) of the Surveyors' Institution; &c.

INTRODUCTORY.

The law of fixtures is an important part of the law relating to property, its importance having made it customary to consider it as a special subject in itself. When applied to property with fixtures of outstanding value, its operation often occasions disputes involving large sums of money. These disputes are mainly between landlord and tenant, and relate to the right to ownership of fixtures, and, in many instances, to liability for repair or dis-repair of the same. Recent decisions of the Courts have tended to enlarge the rights of the tenant.

Disputes as to fixtures also arise, on the death of a tenant in fee simple, between persons entitled to his land and the next of kin of the tenant in fee simple or other persons entitled to his personal property.

Here, the general presumption is that all chattels attached to the soil are part of the land; now questions on this point are not likely to arise in future, since the Law of Property Act, 1925, enacts that both real and personal property shall descend in the same way; all the old rules of succession on intestacy are abolished; the heir-at-law is disestablished and disendowed; and, on a person dying intestate, both his real and personal estate is to be held by a personal representative upon trust for sale, *i.e.*, it vests in the administrator appointed by the Probate authorities.

Upon the death of a tenant for life, the questions as to fixtures arise as between his executors and the remainderman entitled to the land. Here it is presumed that the tenant for life did not intend to make a present of the chattels to the remainderman.

Meaning of the Term "Fixtures."

The term "fixtures" is an ambiguous one. To the lay mind the term would appear to apply solely to personal chattels annexed to land. Technically, fixtures are articles of a *personal* nature which have been affixed to land. The old common law rule was that everything which was affixed to the land became the possession of the owner of the land. "*Quidquid plantatur solo, solo cedit.*" If the rule that fixtures form part of the freehold were invariable, it would have the effect of entitling the reversioner of land to all fixtures left on the land by the previous tenant.

Actually, so many exceptions to the above rule have been introduced that two distinct classes of fixtures are recognised: (1) "Tenant's fixtures," or chattels, which, though fixed to the soil, may be removed by the tenant; and (2) "landlord's fixtures," or those chattels which pass to the owner of the land at the expiration of the tenancy. "Tenant's fixtures" again are divisible according to their nature into (*a*) trade fixtures, *i.e.*, articles erected by the tenant solely for the purposes of trade or manufacture, such as engines, cisterns, plants and trees planted by nurserymen, &c.; and (*b*) ornamental fixtures or articles put up for domestic use as ornament, such as bookcases, marble chimney pieces, dog grates, tapestries, &c.

In a lease of a house the term "fixture" means something which is affixed to the premises after the structure of the house is completed. It does not include things which form part of the original structure itself.

"Tenant's fixtures," while fixed, are part of the freehold, but subject to the tenant's right to sever them during the term and so reconvert them into chattels. (See Horwick *v.* Symond, 1915, 84 L.J., K.B. 1083, C.A.)

"Landlord's fixtures," broadly speaking, comprise those which are on the premises at the time of the letting and which are usually enumerated in the lease and demised with the premises; but, in addition, this term covers all those chattels which have been so affixed by way of and intended as addition to the original structure, and were so affixed either by the landlord, or, if by the tenant, under circumstances in which they were not intended to be removable by the latter. (See Boswell *v.* Crucible Steel Co., 1925, 1 K.B. 119, C.A.)

Agricultural fixtures, or those erected by a tenant of an agricultural holding, and ecclesiastical fixtures, or those erected by the incumbent of a benefice, are subject to special rules and statutory provisions—the former under the Agricultural Holdings Act, 1923, and the latter under the Ecclesiastical Dilapidations Measure, 1923.

The general rule, previously referred to, that chattels, when attached to the soil, are fixtures, may be modified by proving that any such were not annexed for permanent use with, or for the improvement of, the land; but that they were fixed and "steadied" for the purpose of the tenant's temporary enjoyment of them as chattels; and that they, therefore, remain movable chattels.

Questions to be Considered.

In determining whether any item annexed is removable at will or not much depends on the circumstances under which each chattel or fixture was introduced, and the motive of the person fixing it; also on whether the removal is in accordance with any prevailing practice or custom recognised in the locality. The cases go to show that the right of removal in respect to fixtures put up for ornament or domestic use is more limited than that regarding those put up for trade purposes. These questions are suggestive of many points of law, and in further articles these matters will be considered in the light of recent cases, together with the liabilities of landlord and tenant in the event of the whole or part destruction of fixtures, and other allied questions.

The decision of what are fixtures is finally a question of law for the judge to decide. Usually no question of fact arises for decision by a jury.

It is thought that some setting forth of the rights of individuals in respect to fixtures cannot fail to be of interest and use to our readers.

Bridge Building in America.

Work has just commenced on the largest concrete highway bridge yet undertaken in the States, which will be completed in the record time of one year. This huge structure, five miles in length—ten times as long as the Lea Valley Viaduct, England's latest comparable scheme—will be built across Lake Pontchartrain, linking up New Orleans with the Mississippi Gulf coast. The structure, we understand, will contain two bascule drawbridges, one 150 ft. long and the other 110 ft. The viaduct will be an arched-beam concrete structure, 30 ft. wide between curbs, having 35 ft. spans supported on reinforced concrete piles. The roadway, designed for three lines of vehicular traffic, will be 15 ft. above mean water level. There will be a handrail along each side of the bridge, but no sidewalks for pedestrians. The project is being carried out by private enterprise at an estimated cost of £1,140,000, and there will be toll rates of approximately 5s. for each car and driver and 6d. for each additional passenger.

UNEMPLOYMENT INSURANCE.

(*continued from last week's issue*).

The principles laid down by Lord Blanesburgh's Committee for a contributory scheme were as follows:—

(1) The worker's contribution must be moderate in amount. It should never normally exceed 5d. a week, and supplemented by the contribution of his employer and the State should secure him an insurance sufficient in the great majority of cases to save him during inevitable unemployment from recourse to public assistance.

(2) The extent of benefit promised must not tempt the insured contributor to improvidence when in receipt of good pay.

(3) The scheme should provide benefits definitely less in amount than the general labourer's rate of wage, so that there may be no temptation to prefer benefit to work.

(4) It must not interfere unduly with the mobility of labour in this country.

(5) It must not deter from emigration those who would be benefited by a life overseas.

(6) Subject to these conditions the scheme should be made as attractive in its benefits to the insured contributor as, on a strictly actuarial basis, it is possible to make it.

It is with these principles in view that the Committee proceeded to outline

A Permanent Unemployment Scheme.

(1) *Unemployment Fund.*—There should be an Unemployment Fund subscribed in equal proportions by employers, employed, and the State of amounts actuarially certified to be sufficient to enable the outgoings in benefit and administration to be met over a trade cycle.

(2) *Scope.*—The classes of persons to which the scheme is to apply should be substantially the same as under the present system. It should be compulsory upon them and their employers.

(3) *Rates of Benefit.*—There should be paid from the unemployment fund benefits at the following weekly rates:—

	s
Men	1
Women	1
Adult dependants (not more than one for any insured contributor)	
Dependant children under the age of 14	
Young men aged 18 to 21	1
Young women aged 18 to 21	
Boys aged 16 to 18	
Girls aged 16 to 18	

(4) *Conditions for Receipt of Benefit.*—A claimant for unemployment benefit should be entitled to it subject to a waiting period of six days, provided

(*a*) that at least 30 contributions have been paid in the previous two years in respect of him;

(*b*) that he is genuinely seeking work but unable to obtain suitable employment and is capable of and available for work.

(*c*) That he is free from the disqualifications for benefit; showing particularly (i) that he has not left work voluntarily without just cause or been dismissed for misconduct; (ii) that he is not affected by the trade dispute disqualification.

In the case of juveniles the payment should also be conditional on attendance at an approved course of instruction, where such instruction is available (the Committee lay great stress on this).

(5) *Contributions.*—Men 5d., women 3½d., young men aged 18 to 21 4d., young women aged 18 to 21 3d., boys aged 16 to 18 2½d., girls 16 to 18 2d.

For the purpose of extinguishing the

debt on the existing scheme when it is wound up the following additions should be made to the above contributions, these additions to cease as soon as the debt is liquidated:—Men 1d., women ½d., young men 18 to 21 1d., young women 18 to 21 ½d., boys 16 to 18 ½d., girls 16 to 18 ½d.

(6) *Administration.*—The scheme should be administered by the Ministry of Labour through the medium of the Employment Exchanges. Decisions on claims to benefit should be subject to an appeal to the Courts of Referees and in certain cases to the umpire. Where benefit has been paid for a lengthy period the claim should be specially reviewed by the Court of Referees. The cost of administration should be a charge on the fund save that if it exceeds in any year one-eighth of the contributions the balance should as at present be paid by the Exchequer.

The Report contains many pages explaining the above recommendations, and the reasons on which they are based, but our space only allows us to notice one or two points.

In the first place, the Committee point out that where the degrees of risk vary, as is the case now unemployment insurance is so extended to varying categories of workers, there are drawbacks in applying a flat rate of contribution, but that the Committee had reluctantly been compelled to recognise that the flat rate was an unavoidable feature of any workable compulsory scheme of contributory unemployment insurance, and any legitimate grievance on this head is redressed to an extent by the contributions of the other two parties. Mention is made in the above recommendations as to the form of the proposed scheme, to a trade cycle, and in the explanation which follows it will be seen this is a period of 10 to 15 years.

The scheme is based on an actuarial basis and "extended benefit" is to disappear. It is to be observed that the payment of benefit is continuous.

This appears to be one of the most serious questions raised in the Report. The main condition, as will be seen from the recommendations we have set out above, is that the claimant "is genuinely seeking work," but divergent views were expressed by witnesses as to the test to be applied to show that a person is "genuine." The Report states that the Employers' Confederation considered that an automatic test should be applied as well as one more immediately based on the good faith of the claimant—that is to say, very much on the principle now applied the receipt of benefit should be confined to a certain period in a longer period, and further be limited to an amount which would never exceed a fixed relation to the individual's own contributions.

The General Council of the Trade Union Congress, on the other hand, held the view that the length of unemployment in the particular case is irrelevant so long as the person is really genuine and can show that he is still in the insured field. The Committee chose a middle course, but not, it is explained, by way of compromise, in the recommendations which we have set out above, considering that those recommendations will ensure claimants being in the insurance field, and that persons seeking to obtain benefit in preference to employment will be excluded by the second condition that they are not "genuinely seeking work."

The Report contains (page 47) a summary, which does not purport to be complete, of the considerations to be taken into account as to whether a claimant fulfils the conditions. Regard may be had to the periods of time during which he has been unemployed; his qualifications, experience, or training in a particular occupation; his record of previous employments; his prospects of becoming re-employed in his previous or in his usual occupation; his efforts to obtain employment which there was a reasonable chance of his obtaining having regard to the usual means of obtaining it.

But here it is necessary also to note another recommendation of the Committee, which is that section 7 of the Act of 1920 should be modified in such a way that a claimant should only be entitled to decline employment in his own trade and district at wages and on conditions less advantageous than those which he habitually obtained or might reasonably expect, for a reasonable period of unemployment, after which if there is no prospect of his obtaining employment in his own trade within a reasonable time he will be expected to seek suitable employment in some other trade.

A further check is provided by another recommendation of the Committee that when an insured contributor has received unemployment benefit for 13 weeks within a period of six months, the case should be examined by a Court of Referees, and the Committee think that this will prove more efficient than any automatic tests. The Court of Referees would have power if they recommended the continuance of benefit to specify a period, in which case they would again examine the case at the end of that period.

This subject of the continuity of unemployment benefit without a fixed relation to the contributions of the individual is certain to evoke much discussion, and we make the following observations apart from the Report. The provision which we have last referred to does afford a check somewhat akin to that which can be exercised by arbitrators under the Workmen's Compensation Act, as it brings the matter under review; but under the latter Act there is also power to vary the amount of compensation, and in cases where there is a conflict of medical evidence this power has proved beneficial. A slight reduction in the weekly payment has often encouraged a man to overcome the suffering of returning to work after a long period of inactivity; suffering acute in the case of strong men as adhesions have to be broken, in returning to work.

Much has been done by social legislation rightly to alleviate the hardships of the working-classes, but each such measure must tend to lessen the spirit of self-dependence. Where an allowance is made without work for a length of time any person of any class who does not possess a natural inclination for work may prefer to lessen his standard of living and continue idle, and this may be a gradual process, hardly perceptible to himself. Seventeen shillings a week will hardly enable a man to live without work in a condition he would desire to continue, but two men combining can live in one room on 34s. a week, and when benefit is as universal as it is at present this is a possibility to be faced.

A man may have paid his 30 contributions when casually employed on a special job, but with no record of employment behind that.

Without some relation between the contribution and the benefit, and continuity of benefit, it must be remembered that the claimant in his efforts to obtain employment is in a different position to those who are outside insurance altogether, who have that great incentive to make every exertion to obtain employment of some kind to avoid, the danger of starving, or the even greater horror of being supported by the ratepayers.

We have been strong advocates of the principle of unemployment insurance from its first introduction, but we think it must be confessed that with the exigencies of the times since 1921 and the introduction of "extended benefit" it is more than doubtful whether it has not tended to sap initiative.

The above is only a very imperfect summary of some of the matters dealt with in this very interesting and instructive Report, but in the present article we can do little more than glance at it, and we must defer to a second article a notice of the subsidiary problems dealt with in Part II, which include the important subject of Trade Dispute Disqualification.

Obituary.

The death has occurred at Exmouth of Mr. William Hooper, son of the late Mr. H. H. Hooper, painter and decorator, and the youngest of four brothers engaged in the local building trade.

NEW BUILDINGS IN LONDON

Balham High-road.—Rebuilding.—A scheme is being proposed for the alterations to the Balham Picture House, 174, Balham High-road, S.W. The seating capacity will be increased to over 2,000. The sum of about £25,000 is involved. The architect is Mr. Clifford Aish, 22, Bedford-street, Strand, W.C.2. The building contract has not been let yet.

Edgware-road.—Cinema.—A further development has taken place in connection with the "Regal" Cinema, which is to be erected on a site at the corner of Marble Arch and Edgware-road, W.1. Messrs. C. H. Abrahams, of Wedmore-street, N., have secured the contract for the demolition of the buildings on the site. The building contract has not yet been signed.

Hackney.—School.—On the site of the old Upton House Industrial School, Hackney, the London County Council propose erecting a central school for boys, and an open-air school for about 130 children.

Houndsditch.—Building.—The City Corporation has approved an application by Messrs. Stone & Drew, architects, 12, newcourt, W.C.2, for consent to the erection of a building at Nos. 49/52, Houndsditch.

Merton.—Hospital.—A sum of £20,000 is to be spent on extensions to the Nelson Hospital, Merton, S.W. Mr. Thomas, Hill-road, Wimbledon, S.W.19, has prepared the plans.

Merton.—Houses.—The Triangular Construction Company have secured the contract for the erection of 100 houses for the Merton and Morden Urban District Council. The houses are to be erected on the Whatley-avenue and Cannon Hill-lane sites, the price of the accepted tender being £48,000. Mr. G. Jerran, engineer to the Council, prepared the plans.

Newgate-street.—Premises.—Messrs. Griggs & Son, of Westminster, S.W.1, are erecting new premises on a site at the corner of Newgate-street and Ivy-lane, E.C. The plans have been prepared by Messrs. Trehearne & Norman, architects, Windsor House, Kingsway, W.C.2.

Notting Hill-gate.—Reconstruction.—The Notting Hill-gate, W.11, Metropolitan Railway station is being reconstructed to the plans of the Chief Engineer to the Railway Company. The builders are Messrs. W. J. Maddison, Ltd., 124, Minories, E.1.

St. Pancras.—Flats.—The Borough Council of St. Pancras are to erect 88 flats at Wolcot-street, Somers Town. Messrs. Waggett & Bradford, 12, Regent-street, S.W.1, are the quantity surveyors. Tenders are now being invited.

Southwark.—Accommodation.—At a cost of £21,000, the Southwark Board of Guardians are to provide accommodation for nurses, at the East Dulwich-grove Institute. Messrs. Saxon Snell & Phillips, 9, Bentinck-street, Manchester-square, W.1, are the architects.

Stepney.—Dwelling.—The London County Council are inviting tenders for the erection of four blocks of dwellings on the Wapping Estate, Stepney. Mr. G. Topham Forrest, F.R.I.B.A., has prepared the plans for the scheme.

Tooting.—Cinema.—A new cinema is to be built on a site in the Upper Tooting-road, a few hundred yards from the "Broadway" Tube Station. The new building will seat over 2,500 persons, and plans also include the addition of a Palais de Danse with a floor to accommodate 1,000 people. The scheme will cost about £90,000. Messrs. Ernest Long & Co., 27, Lincoln's Inn Fields, W.C.2, are the solicitors to the purchasers of the site.

West Ham.—Power Station.—Messrs. Wm. Blay, Ltd., of Dowgate-hill, E.C., are the general contractors for the new boiler houses now being erected for the Electricity Works. Messrs. Young and Co., 6, Queen Anne's-gate, S.W., are supplying the constructional steelwork. Mr. H. de Colleville, of 48, Bedford-row, W.C.1, is the consulting engineer.

RATES OF WAGES IN THE BUILDING TRADE

(For rates of wages in the Building Trade in Scotland, see page 708.)

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

Following is a list of abbreviations:—Borough Surveyor, B.S.; Borough Engineer, B.E.; District Surveyor, D.S.; Clerk, C.; Town Clerk, T.C.; County Engineer, C.E.; County Surveyor, C.S.; County Architect, C.A.; Surveyor, S.; Engineer, E.; Borough Architect, B.A.; Architect, A.

TRADE NEWS

Gas Stoves and Geysers.

Messrs. The Davis Gas Stove Co., Ltd., of 60–62, Oxford-street, W.1, have issued two new catalogues, one referring to their gas cookers and the other dealing with their latest types of geysers. Special features of the "Davis" geysers are interlocking taps and the "Davis" automatic valve which prevents gas coming through to the burner before the water enters the geyser. The body of any "Davis" sealed type bath geyser may be lifted off the base, so that the burner may readily be cleaned without disconnecting gas, water or condensation. This type of geyser with its attractive finish should be popular. The catalogue will gladly be sent upon application to the company.

Friction Grip Pivots.

We are advised that the special friction grip pivots used exclusively for the windows of the new L.C.C. Secondary School, Sutherland-grove, Putney, illustrated in "The Builder" for April 15, were supplied by the manufacturers, Messrs. Samuel Parkes & Co., Ltd., Pretoria Works, Willenhall. Windows fitted with these friction pivots, ensure good ventilation, and the makers will be pleased to send particulars to anyone interested.

Electrical Exhibition, People's Palace, E.1.

Messrs. J. Sagar & Co., Ltd., manufacturers of woodworking machinery, of Canal Works, Halifax, whose London Offices and showrooms are at 119–121, Finsbury-pavement, E.C.2, are showing at Stand No. 4 of this Exhibition, held from April 29 to May 7, a display of a representative selection of modern woodworking machinery, especially suitable for builders, contractors, and others who require the costs of wood-working operations to be reduced to a minimum. Their "Premier" combined hand and roller feed planing, thicknessing, moulding, &c., machine (AF), is on show as are also several others of their machines.

THE SCOTTISH BUILDE

NEW BUILDINGS IN SCOTLAND

Falkirk.—Garage.—The Dean of Guild Court has approved the erection of a new garage at Callendar-road at an estimated cost of £1,900 for Mr. J. M. Millar, of Falkirk.

Motherwell.—Buildings.—The Motherwell and Wishaw Dean of Guild Court has passed the following plans:—Alterations and additions to the Burgh Weighhouse in Clyde-street at £230; railway siding at the gas-works for the Corporation at £5,165.

Paisley.—Building.—The Dean of Guild Court passed the following linings:—Distillers' Company (Ltd.), office at distillery in Sausel-street, Paisley; and Messrs. J. Y. Keanie, two semi-detached cottages at Lanfine-road.

Stirling.—Housing.—The Town Council has reported that the Scottish Board of Health have intimated their approval of the erection of 96 houses.

Dumbarton.—Houses.—The Dean of Guild Court have passed plans for 96 houses for the Town Council.

Irvine.—Building.—The Town Council has decided to convert the old lifeboat shed at Irvine shore into a bathing station and refreshment room.

Edinburgh. — Extensions. — The Parish Council has approved the recommendation of the Works Committee to proceed with a scheme providing for the alteration and extension of the nurses' accommodation at Craiglockhart Poorhouse, at a cost of £4,860.

Forres.—Cinema.—A local syndicate is to build a new cinema, estimated to cost £5,000.

Stirling.—Buildings.—The Prison Commissioners for Scotland have approved of the plans submitted by the Town Council for the erection of new police buildings adjoining Allan's School in Spittal-street.

Grangemouth.—Houses.—The Town Council has agreed to proceed with the erection of 12 houses, also two blocks of four h each. Plans are also to be prepare 48 houses.

Dalbeattie.—Housing.—The Town Co has received the approval of the Boar Health for a new housing scheme to pr twelve dwellings.

New Scottish Highway.

A section near the eastern end of Glasgow-Edinburgh road, which forms pa a national scheme to relieve unemploy has now been completed, and was open April 21 by Sir Henry Maybury. The sec which is about a mile and a half long, f a by-pass between the road connecting Gla and Edinburgh via Airdrie and Bathgate the Queensferry-Edinburgh road. With completion of a further section a valu thoroughfare leading direct to the nort districts of Edinburgh and to Leith wil available for traffic.

Building Trade in North-East of Scotlan

In resigning the presidency of the N East of Scotland Master Carpenters' Joiners' Association—a position he has during the fourteen years of its existence the recent annual meeting in the Imp Hotel, Aberdeen, Mr. John Buchan, form of Monymusk, made an appeal for gr unity among the members. For several y be said, there had been a considera amount of apathy among some of the mem It weakened the influence of the Associa and tended to dispel the unity and good fe which the Association had done so muc create and foster in its early days. It c not be said that trade had improved du the past year. The cost of all buil materials was still too high to give a stim to speculation. The Rent Restriction had been a drag on the wheels of their ind for the past seven years, and one feared it would continue for some time yet.

Mr. William Frain, of Hazlehead, Aber was elected president for the ensuing year

BUILDING TRADE WAGES IN SCOTLAND

The following are the present rates of wages in the building trade in the principal towns Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for er that may occur:—

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

. CXXXII.—No. 4396. MAY 6, 1927.

CORPORATE INFLUENCE

MR. JOHN A. KNOWLES has recently been investigating the truth concerning the Mediæval Gilds, and his paper on the "Artistic Craft Gilds of the Middle Ages," published in the R.I.B.A. *Journal* of February 19, must have come as a shock to a good ny architects and others who hold the conventional and venient beliefs concerning artistic life during the Gothic od. Truth too often lies as an unseen sediment beneath yer of invention and romance, and few can have read this er without a feeling of disillusionment. When we wish to e a name to a group of artistically impelled workers, each king for a negligible remuneration in the cause of the art oves, we call it "The ——— Guild," and are satisfied that are relighting a candle that burned brightly during the Middle s. Mr. Knowles's researches indicate that our picture of diæval artistic life is of our own manufacture, steeped in the ance and glamour due to the passage of time. The mediæval appears in reality to have been a trade union, run, when ged in comparison with modern standards, on decidedly rior lines, where the masters ruled the roost and spent their enuity in preventing the workers from increasing their earn-. The municipalities were compelled to devote a good deal ime to framing regulations in order to prevent the gild nbers from cheating the public. Thus the municipality of k, for the public protection, had to enact that no stained s above the value of half a mark (6s. 8d.) should leave the until it had been inspected, to see that "therein be noo cyt unto the King's peple." Religion was, it appears, too n merely a pretext used by the masters to squeeze the lic and by the men to try to increase their wages.

This exposure of the methods of the Middle Ages is perhaps, holesome corrective to our present-day pessimism, but it intensifies the mystery of mediæval corporate achievement rchitecture. The fabric account rolls of cathedrals show that the more refined work was executed, not by gilds, but by pendent workers and craftsmen living in the towns, owning r own shops, and employing their own apprentices, who gave ice, did the work, and sent and fixed it exactly as we do to-. The gilds apparently no more traded for profit than does R.I.B.A., and consequently there could have been no such g as "participation in a division of profits"—a conception is now almost universally accepted. But if the curren efs concerning the gilds and their homely artistic zeal bear e relation to fact, they represent, at least, a high ideal on our , and if they could be put into practice to-day on a large e, and combined with a corporate appreciation of architec-l significance, they might well constitute a step towards ther great period of building.

A sense of corporate emulation is unquestionably being uraged through the rapid development of our architectural ols, and this carries consequences greater than can be sured in terms of improved qualifications. If the ideal ate office was capable of supplying the ideal apprenticeship, ired by the personality of the chief, and guided by practice, such a system was inimical to a corporate movement of itecture as a whole. The schools alone appear to be capable ntroducing an element of social intercourse, and hence e exchange of ideas between different generations and, with advent of the woman student, wives and daughters can be vn into the circle, thus widening the domain of architectural ght more effectually than might appear at first sight. The element, the opportunity for foreign travel, where staff and students, old and young, mix naturally, all tend to generate a corporate spirit that must exert a profound influence on future work and outlook. The corporate spirit of the Middle Ages dictated uniformity—the domination of one, and only one, style, but under modern conditions it would appear to tend rather towards diversity, but always with the consciousness of a mass opinion and sentiment in the background. In such an atmosphere, criticism must become accentuated and, while there is the danger that some of the newer experiments may result in failure, yet we shall at least be sure of escaping eventually from servitude to accurate reproduction and the "Pompier," which we might translate "Shepherd's Pie," architecture, where old *motifs* are faithfully repeated in grandiose but lifeless juxtaposition. If the corporate influence of the schools introduces a levelling up in design, material, and detail, it will be all to the good, although, so far as one can see, it is almost impossible that we can again give a corporate contribution of the kind left by the Greek and Mediæval civilisations.

One of the most hopeful signs is the constantly increasing amount of space devoted to architecture in the general Press. Some thirty years ago it was the fashion for the literary man to cultivate an acquaintance with painting, and this cultural move has now been extended to embrace architecture. Such outside recognition was no doubt materially assisted by the considerable number of pioneers within the profession and a few well-known literary names, but it had its origin in the absolute necessity of awakening a sense of public responsibility if the beauty of our country and our heritage of fine building were not to be lost altogether. Indeed the present movement could have been foretold even in pre-war days. The war, and the liberation of thought that followed it, merely precipitated a corporate movement that was inevitable. It was inconceivable that England could lag behind the continent at a time when international intercourse had become closer than ever and when modern inventions had brought us into intimate contact with all that was going on elsewhere.

It is impossible to exaggerate the influence upon architecture of modern travelling facilities, of the drawings now available, showing in detail every new building throughout the world, and of the architectural photograph. In many ways, photography is the most remarkable of all our modern inventions, and although we now take it as a matter of course, to the Londoner of three hundred years ago it would probably appear as magical as wireless and the aeroplane. All that we can hope for in the immediate architectural future is a reintroduction of vitality into our designs and an avoidance of the errors peculiar to the last century. Industry and science advanced too fast for the arts to keep up with them, and in trying to force new conditions into old frameworks it appeared impossible to serve the two types of frame; either one cleaved to Gothic and despised the classical, or one worshipped the classical and condemned the mediæval. We have achieved something already if we have learned to appreciate and revere both but to serve neither. In the future one hopes to see a growing corporate spirit expressed in a critical camaraderie that will pleasantly ridicule the affected and scorch the definitely inane, but let us hope that it will have enough of adventure behind it to encourage legitimate experiment and so create a scope for the development of original talent. The rigid discipline which, by its criticism or conventionality, makes individualism sterile is no friend to the art it professes to serve, and it carried the seeds of its own destruction.

P

NOTES

Architectural Quality. We have endeavoured on another page to give a general idea of the contents of the architectural gallery at the Royal Academy, but we are fully conscious how nearly impossible it is to offer anything in the way of useful criticism. We think we could give some useful hints to students of what to avoid by reference to the exhibited works, even by highly accredited architects. In distinction of emphasis, pleasing proportion, and unity of design we find some large and important buildings singularly at fault, and we can only hope that those who are to be our architects of the future will find means of learning what are the prime essentials of good architecture. We fear that it is chiefly in the smaller subjects in this exhibition that the lesson may be found, such as Nos. 1338, 1312, 1287, 1265 and 1239. It would be amazingly instructive to those who have the future of architecture in their hands if anyone really alive to all the great essentials of fine art could point out to them and correct the failures of Academy subjects by a broad analysis on the blackboard.

Models. In view of the two large models in the Architectural Gallery at the R.A., where space is very limited, and the small and interesting models now in the Architectural Exhibition at the R.I.B.A., it will occur to most people that the facts might well have been reversed. The models at the Institute are very good and are such as would give general pleasure to the public. But the severely architectural qualities of the models at the Academy and their great size render them unsuitable for the R.A. We suppose the model of the Midland Bank's new head office in the Poultry is about the largest ever shown at the R.A. The architects, Messrs. Gotch & Saunders, F.F.R.I.B.A., with Sir E. L. Lutyens, R.A., might have been wiser to be content with a drawing, for we suppose the upper stories of the building will hardly be seen from the street, and this has apparently been in the architects' minds, for the upper recessed portion has little or no concern with the lower part of the building.

Good and bad Architecture. Knowing something of the difficulty of obtaining a concensus of opinion as to what is good or bad in Art, we should still like to emphasize our contention that large and important modern works ought not to be rejected by the R.A. if they are reasonably well illustrated. When architects take the trouble and expense of preparing drawings for the R.A. they may fairly look for some clarity of outlook and judgment in regard to their work, and they are justly critical when they find fairly good and often quite important work rejected, whilst subjects are accepted which are quite unworthy of an Academy exhibition. We have in our mind exceedingly good work which has either not been sent to the Academy or has been sent and rejected and we consider this is detrimental to the better understanding and appreciation of architectural art by the public. We are quite aware that we are speaking of an Academy of Art, but if they raise a high standard for acceptance should they not reject much they now accept? If they are reasonably clear as to what is good or bad, how is it that they accept all they do?

The Society [of Master Glass] Painters. The meeting held recently in the Hall of the Art Workers' Guild, when Mr. Campbell Dodgson spoke on "Early German Woodcuts in relation to Stained Glass," was of considerable interest. Illustrating his address with numerous woodcuts and o designs of ancient character, the lect pointed out certain similarities of tr ment which suggested the influenc these early woodcuts on stained g design. The lecturer raised the po whether it might not be concluded stained glass design derived most f this source, so much is there in com between them. It may seem a somew academic issue as to which was the in regard to this influence on one or other, and the point of importance more in the use made of such influe whichever way bestowed. The g artist absorbs what he derives f others, until it all becomes part of h self, born again in time, for there is such plagiarist as the great man demands the whole world for his pa mony. The interest in such consid tions as those raised by Mr. Dodg are not lessened from the fact that for art of stained glass there is nothing n important than that the artist should freed from them at the present time. do not appreciate any longer the end reminiscences and imitations of outw treatment and archaic manner, but l for the first hand inspiration of life vision to-day. The ecclesiastical tradi of art lingers only as a survival, acting dead hand on art obstructive of gen feeling and freedom to expression.

The Value of Traditional Influences. The value of these influe are in no way however t disregarded, and there every advantage, used ri ly, in acquaintance with best examples of earlier periods. Bu order to inspire our own work, we h to learn through it that all art w endures has the quality of first-hand perience and vision, depending on its contribution, not on its likeness to w has gone before. To cut ourselve from the past is no less impossible undesirable, but appreciation lies emulating its noble spirit not in borro

A Terra-cotta Filling Station in America.

e forms through which this found xpression. We have our own message nd interpretation, and only through the roper, disciplined emergence of this as rt, truly related to the past, while at the me time securing in its character the romise of permanence and value, can we e said to have an art at all.

onserving our Streets.

THE interest now being shown in the conservation of the character and permanence of the older streets and houses in London comes a time when the absence of this spirit nd the consequent destruction entailed rough disregard of it is very well nderstood. It is, however, not easy to cide how far this conservation can be cured, or how far it is desirable. Build-g has to meet the requirements of our vn time, which entails difference, and e cannot expect that streets can remain ways secured from the changes time ings along with it. At the same time, ry much depends on the character of e demands made and the power of the chitect to exercise his judgment as to nat changes are inevitable and how they ould be carried out. It is unfortunately e case to-day that premises often aim being a sort of advertisement of the rticular business interests concerned d do not include in the outlook of those sponsible for them the obligations to e community and public interests ich should prevail over private ncerns. We see examples of this many of our streets, squares and open aces. As an instance, we may refer to e new stone-fronted building recently rust into the middle of the older and aracteristic architecture in one of our eets. How this sort of violation can remedied it is not easy to see, as it ends more on public spirit and hitectural appreciation than in any slative enactments. Our wish must hat London should come first, and that at we renew, or alter, in the past litions of buildings, should be governed this better spirit.

ractical ectures for chitects.

A CORRESPONDENT writes to inform us that the Board of Architectural Education are considering very favourably the proposals to arrange a es of lectures for practising architects wing the relation of modern science rchitectural practice. The need for a lectures was shown at the demonstra- that was given by Professor E. G. er, Professor of Engineering at Uni- ity College, London, on the use of natic rays for recording the stress on els of building structures. This series ctures will have two main objectives : first to revive forgotten knowledge, second to acquire modern knowledge. felt that the strain of modern pro- onal life makes it difficult for practis- architects to obtain data on the nce of building science. Among the ects of the lectures that it is hoped rrange in the near future will be : Strength of Materials, (2) Materials, their use and nature, (3) Design in Steel, Concrete, Timber, etc., (4) Heating, Lighting and Ventilation, (5) Gas and Electric Installations, (6) Building Acts and By-Laws, (7) Light and Air and other Easements.

ROYAL ACADEMY EXHIBITION, 1927.

"The Centaur" Relief (working model for Sunken Panel to be carved in wood over mantelpiece).

BY MR. WILLIAM C. H. KING, Sculptor.

New Thoroughfares.

WE quote the following from Professor Richardson's interesting paper read last week before the London Society. "Because of the fettering of tradition, the obsolescent building clauses of the Act, the iniquitous rulings of the laws of ancient lights, and the lack of unity in street designs, nothing resulted except quarrelling with the older and more satisfactory values which were out of date. New buildings, such as Adelaide House, Bush House, Devonshire House and some of the recent office buildings in the City proved the limits to which the treatment of Portland stone attached to the steel skeletons could be taken. Those buildings had merit, but they were piecemeal contributions to ancient London. The effect of new main thoroughfares would be to link up the existing squares and open spaces and to reveal the majesty of the historic buildings, many of which could not be properly seen to-day. The new streets would provide scope for comprehensive design. There would be room for imaginative designs. For example, blocks of retail stores could be schemed with roofways and flying bridges connecting the blocks. There would be shops at three levels and batteries of lifts at intervals. The upper ways would call for extra policing, but they would all be closed at night. Had both sides of Regent-street been planned on these lines, a species of Uffizi Gallery would have resulted, giving London one of the finest open shopping arcades in the world.

Filling Stations.

WE recently referred to the filling stations for cars which are springing up on all sides and the somewhat vulgar effect which so many have. In some cases these affairs strike a lively and not altogether unpleasant note at our road sides, but we could wish that some good artistic control were available for such things. The example we illustrate from America may go to the other extreme in giving an effect of almost monumental dignity, but the means of clothing simple useful things like this with some agreeable artistry ought to be within our reach. It is in the handling of such simple affairs of everyday life that we are so lacking nowadays in our artistic capacity.

Colonial City Developments.

THE wider outlook towards the future, which is steadily developing amongst municipal authorities to-day, is evidenced in far-away Auckland by the careful report which has been prepared for the council of that city. So far as one can gather, the expert advice which has led up to the report is sound and well justified. The ultimate convenience as well as the dignity of this growing city appear to have been well considered, though time alone can show whether the scheme in view may not err on the side of timidity, costly though it appears. We may be fairly sure that in such a great city as London it is very unlikely that a forecast of the future will lead to sufficiently bold and adequate schemes. Failing the mischances of revolution and war, it is hardly likely we can fully realise the potential future of London. Even in Auckland it is possible that the idealist and dreamer of to-day will be proved to have been the most practical theorist for the future.

GENERAL NEWS

Professional Announcement.

Mr. James D. Morton, P.A.S.I., quantity surveyor, has removed from 3, Cable-street, to Wellington-buildings, The Strand, Liverpool. Telephone : Bank 745.

The Rowand Anderson Scholarship Award

The Rowand Anderson Scholarship for this year has been awarded by the Incorporation of Architects in Scotland as follows :—1st prize (medal and £100), Mr. Frederick R. Wylie, 2, St. Mary's-place, Glasgow; 2nd prize (£20), Mr. A. Gordon Lorimer, 212, Bath-street, Glasgow.

Bequest to a Church.

Miss Ethel Annie Worthington Cranmer, of Buckingham-place, Brighton, who died on February 21, left, amongst other bequests, "£500 to the vicar and churchwardens of St. Mary's Church, Upper Rock-gardens, Brighton, for carving one of the panels in the wall of the sanctuary by the side of the reredos with an appropriate subject, if possible to be the "Visit of the Magi," but if this cannot be done, then the said sum is to be used in some other way for adding beauty to the interior of the church."

Research Scholarships in Technology.

The Manchester Municipal College of Technology gives notice that a limited number of Research Scholarships in Technology (each of a value not exceeding £100) will be awarded in July, 1927. These Scholarships are tenable during the academic year 1927-8 in the Manchester Municipal College of Technology (Faculty of Technology in the University of Manchester). Applications must be received on or before July 6, 1927. Forms of application and all information may be obtained by written application to the Registrar of the College. Research may be undertaken in any, amongst others, of the following departments :—Mechanical engineering, electrical engineering, municipal and sanitary engineering, and applied chemistry.

Obituary.
Sir T. Duncan Rhind, A.R.I.B.A.

The death has occurred at Brighton of Lieutenant-Colonel Sir Thomas Duncan Rhind, A.R.I.B.A., who was for many years an architect in Edinburgh. He had been ill for some time. A son of the late Mr. John Rhind, A.R.S.A., sculptor, he was born at Edinburgh in 1871. He served his apprenticeship as an architect in the office of the late Mr. Hippolyte J. Blanc, R.S.A., and was afterwards for a time in a London office. On returning to Edinburgh he became a partner of the firm of Messrs. Paterson and Rhind, and after the death of Mr. Paterson he carried on business on his own account. His elder brother is Mr. W. Birnie Rhind, R.S.A., sculptor.

Old London Illustrated.

The Right Honourable Viscount Astor presided at a lantern lecture delivered recently at the Cliveden Estate Recreation Hall by Mr. Herbert A. Cox (author of "Old London Illustrated"). The lecture was illustrated not only by the drawings of London in the time of Henry VIII by the late H. W. Brewer, but also by three valuable models: (1) Old London Bridge, (2) the Mill Lock Arch discovered in 1921, (3) London's First Waterworks, founded in 1582, all of which are the property of *The Builder*.

His lordship said that when he saw the picturesque character of Old London he wished he had lived in those days, but as he listened to the description of London's first water supply, obtained direct from the river, he came to the conclusion he was glad he lived in these days of pure water.

The lecturer dealt fully with Old London Bridge and Old St. Paul's Cathedral, and also took his audience to the Tower of London, Aldgate and Cheapside.

Architect's Estate : A Bequest to the R.I.B.A.

Mr. Charles William Hunt, A.R.I.B.A., of 132, Station-road, Ilkeston, architect and surveyor, left estate of the gross value of £7,999. Among his bequests were £500 to the Royal Institute of British Architects, the income to be expended in the purchase of book prizes or medals for persons of British nationality under the age of 30 years who each year, in the opinion of the Institute, submit the best plans, drawings, or designs in connection with housing or town-planning or similar purposes. Subject to the payment of some other legacies and bequests, he left "the residue of the property in equal shares, if it does not exceed £2,000, for the vicar and churchwardens of Burwell, Cambridge shire, and the Royal Institute of British Architects for like objects as mentioned above, but if it exceeds that amount any surplus shall be paid to the priest and Building Committee of the Catholic Church of St. Thomas and St. Mary, Ilkeston, for embellishing the High Altar in the said church."

Strode Park Estate House Design Competition.

The Strode Park Estate offers to the competitor submitting the best design for a private house on this estate, near Herne Bay, Kent, prizes as follows :—On Group A.—Main Road.—Minimum cost of house £1,500, a prize of a site with 100 feet frontage 300 feet deep, value £350. On Group B. District Roads.—Minimum cost of house £800, a prize of a site with 50 feet frontage, 250 feet deep, value £100. On Group D. East of Suggested Road.—Minimum cost of house £450. A prize of a site with a frontage of 50 feet and a minimum depth of 200 feet, value £50. Designs, consisting of plans of each floor, front and back elevations, sections and lay-out plan, with a general description of the construction, to be delivered to the Secretary, Estate Office, Strode Park, Herne, Kent, from whom full particulars may be obtained, by June 30, 1927, with an estimate of the total cost. One condition of the competition is that each competitor will have to undertake to erect and complete before December 31, 1927, upon the prize plot a house in accordance with the prize-winning design, conforming with the local by-laws.

Rome Scholarship and Henry Jarvis Studentship, 1928.

Conditions and details—obtainable from Mr. Evelyn Shaw, Office of the British School at Rome, 1, Lowther Gardens, S.W.7—are now available of this scheme of competition for the Rome Scholarship in Architecture, 1928, offered by the Commissioners for the Exhibition of 1851, and for the Henry Jarvis Studentship, offered by the Royal Institute of British Architects. The Rome Scholarship will be of the value of £250 per annum, and will be tenable at the British School at Rome for a maximum period of three years. Candidates must be British subjects and less than 30 years of age on July 1, 1928. The Jarvis Studentship will be of the value of £250 per annum, and will be ordinarily tenable at the British School at Rome for two years. This Studentship will be confined to candidates who are, or who in the opinion of the Council of the Royal Institute of British Architects are eligible to become, Students or Associates of the R.I.B.A., but otherwise the conditions for the two awards will be the same. The competition, which will be conducted by the Faculty of Architecture of the British School at Rome, will be in two stages, viz. : A preliminary competition open to approved candidates and a final competition open to selected and approved candidates. Application to compete in this competition must be made on the prescribed form to the Honorary General Secretary, British School at Rome, 1, Lowther Gardens, Exhibition Road, London, S.W.7, not later than October 15, 1927.

COMPETITION NEW

Birmingham Civic Centre.

The sending-in date for this competitio June 30th, not May 16th as we have pr ously stated. Mr. H. V. Lanches F.R.I.B.A., M.T.P.I., is the assessor. signs have to be sent to Mr. H. Humphries, M.Inst.C.E., M.T.P.I., Engineer and Surveyor, the Council Ho Birmingham.

COMPETITIONS OPEN.

Lay-out and architectural treatment of approaches to the Palais de Justice, Brussels. Apply M. Le Conservateur du Palais de Justice, Brussels. International competition. No premiums offered, but successful competitor to be remunerated on Belgian scale.	Mar. 18 .. Jun
Grammar School, Bradford, for 1,000 boys. Premiums: £300, £200, and £100. Mr. Arnold Mitchell, F.R.I.BA., assessor. Apply Mr. W. Brear, Secretary, Grammar School, Bradford, Yorks. Dep. £1 1s. ..	Feb. 18 and Mar. 4 .. —
Edwin Austin Abbey Memorial Scholarships for Mural Painting. Two Minor Scholarships of £125 a year each, and one Major Scholarship of £250 a year. Candidates must not be over 25 and 27 years of age for the respective Scholarships on December 31 preceding the competition. Apply Secretary, Edwin Austin Abbey Memorial Scholarships, Chelsea Lodge, 42, Tite-street S.W.3	June 11 . J
Shakespeare National Memorial Theatre, Stratford-upon-Avon. Competition open to architects of the British Isles and America. To be held in two sections: first, Sketch Designs, from which six will be selected, and the authors each paid £100 towards cost of preparing more detailed schemes, which will form second part of competition. Selected architect will be paid in accordance with R.I.B.A. schedule of charges. Apply Secretary, Shakespeare Memorial Theatre, Stratford-upon-Avon. Deposit, £1 1s. Assessors, Messrs. Robert Atkinson, F.R.I.B.A., E. Guy Dawber, P.R.I.B.A., and Cass Gilbert.	Ju (F Jan. 14 .. Dec
University Buildings, Western Australia. To cost £150,000. Premiums: £400, £300, £200. Open to British subjects or citizens of U.S.A. Assessors: Professor Leslie Wilkinson, F.R.I.B.A., Mr. A. R. L. Wright, L.R.I.B.A., President Royal Institute of Architects of Western Australia, and Member of University Senate Apply Agent-General for Western Australia, "Savoy House," 115-116, Strand, London, W.C.2, or Australian Trade Commission, 44, Whitehall-street, New York, U.S.A.	Jan. 14 .. A
Cemetery Chapel, Reading, for Corporation. Open to architects residing or practising in Berks, Bucks or Oxon. Premiums: 50 and 25 guineas. Apply Borough Surveyor, Town Hall, Reading. Deposit, £2 2s. Mr. Charles J. Blomfield, F.R.I.B.A., Assessor, 13, Ashburn-gardens, London, S.W.7, to whom designs have to be sent.	April 15..
Private Houses, Strode Park Estate, Herne, Kent. Three prizes of free sites, value £350, £100 and £50 offered for best designs for private houses to cost £1,500, £800 and £450 respectively, and to be erected on prize-winning sites. Apply, Secretary, Estate Office, Strode Park, Herne, Kent.	April 22..

Memorial Windows at Oxford.

Viscount Cave, the Lord Chancellor, unveil, on May 17, in the Old Ashm Oxford, memoral windows to Elias Ash Sir Christopher Wren, and Dr. Robert the first Custos. The Royal Institu British Architects is giving the Wren wi

ROYAL ACADEMY EXHIBITION, 1927.

Proposed Catholic Church, Ashford, Middlesex.

SIR GILES GILBERT SCOTT, R.A., F.R.I.B.A., Architect.

ARCHITECTURE AT THE ROYAL ACADEMY

If we could have an Academy exhibition which was truly representative of the best architecture of the time, it would perhaps be quite as interesting to the public as the kind of exhibition they do get, and it might afford some real encouragement to architectural art. That many studies of architecture are not accepted solely on their merits is evident enough unless we are to form a very low estimate of the judgment of the Hanging Committee. We can hardly believe that those who from year to year are responsible for what is accepted and rejected take a quite fair view of their responsibility. During a long experience, we have endeavoured to discover whether any fair principle of action has guided their judgment, and we must confess that only in two or three instances have we felt that a sound and equitable judgment has been exercised. It has generally been known either before or after the exhibition with whom lay the chief responsibility, and we believe it is undoubtedly true that the fairest and most satisfactory selections have been made by the late Alfred Waterhouse, not to mention one or two living men. We do not venture to do more than offer, with all respect, a few suggestions as to how we think a more satisfactory way might be found to deal with architectural subjects at the Academy. There is first the question whether everything good should be accepted and everything bad rejected. As to the rejection of what would be generally considered bad work, there would be few exceptions. Large and important works even if "bad," should sometimes be hung, and all bad works of inferior importance absolutely rejected, even though of a convenient size or attractively set forth. Good works would all be accepted unless of insufficient importance or value for public exhibition. If some such general rule as this was observed, the present and many former exhibitions would have been largely altered. But when this has been said, we have to remember the personal preferences of the Hanging Committee which will account for the varying definitions of what is good or bad in any work of art. Some excellent examples of modern Gothic would never have been exhibited but for the hanging by Pearson or Bodley or Jackson, and this leads to the suggestion that the Selection Committee should include those of the most divergent views. Having decided that everything bad should be rejected, except where it is of special importance, the Academy would have cleared itself of any possible reproach that it sets no high standard of accomplishment and confers no honour by its acceptances.

Obviously, the next consideration is the quality of representation of the various works sent in, for the Academy aims to appeal to the general public and to put before them exhibits of genuine attraction. There is no need, however, for architects to resort to the exhibition of merely pretty pictures, and they do not belittle the dignity and gravity of their art if they essay to render their designs in as near approach to the real results as built. It is not even necessary that colour should be used, for monotone often suggests colour. But no gorgeousness of colour on paper is likely to overstate the brilliance of a theatre interior or a ballroom, and it is in this respect that we find nothing but pleasure in the brilliant colour interiors of Mr. Robert Atkinson or Sir Edwin Lutyens, or the colour section of Mr. Dixon-Spain. In some respects we may prefer the delicate tone and colour effects by Mr. Goodhart-Rendel, but such things are perhaps too dainty and refined to be popular. As an example of general articulation of the facts of a design we could hardly have anything better than the gay drawing by Walcot, or the fine design for the Masonic Memorial Building by Messrs Louis de Soissons and G. G. Wornum (in 1245). If the same artist had treated Sir Aston Webb and Son's Army and Navy Stores (in 1297) just in the same way the breadth and dignity of the design would have been far better realised. To take another example of representation, how telling is the sketch of Mr. Mervyn Macartney's Sovereign's Throne, in St. Paul's Cathedral (1287); the real and telling effect of the admirable design is apparent to all.

In the Church of St. Mary and St. Thomas at Gorton (1265) Mr. Walter Tapper is fortunate in the real and broad effect of the colour view by Mr. Farey, and one is almost inclined to think on seeing this design that it is not absolutely necessary for Mr. Tapper to work in pure Gothic. Mr. Curtis Green exhibits six beautiful drawings (though perhaps four would have been enough!) of broadly treated, dignified work, and here the representation of the work seems quite right even for a popular gallery. Then in the view of the Piccadilly end of the Quadrant one may realise the truthfulness of expression of Sir Reginald Blomfield's able control of the lower end of Regent-street, wherein he has carried on the Norman Shaw tradition, so that all round about this part of Piccadilly-circus we shall have something of a real unity and dignity of effect. The accepted design for the Masonic Memorial Building in Gt. Queen-street (1313) by Messrs. Ashley and Newman, might have been more convincing perhaps if seen differently from this view, for the general elevation, which is balanced and good, does not fit in quite pleasingly with the angle tower.

The Lloyds Bank view (1260), by Sir John Burnet and Partners, is effectively illustrated in a charcoal or pencil sketch by Mr T. S. Tait which we have illustrated. This shows how satisfactory a fine pencil sketch on a large scale may be. Mr. Guy Dawber's Foord Almshouses, Rochester, are shown in a pleasant colour view (1306), and will we think be certain to be one of his most successful works. King Feisul's new palace at Bagdad is tellingly shown in a coloured view (1307). Mr. Ja's. M. Wilson, the architect, has cleverly treated this with a good oriental feeling. The Courtyard view of Messrs. Richardson and Gill's University College (1312) is another graphic illustration of agreeable design. The admirable design for the Leeds University, by Messrs. Lanchester, Lucas and Lodge, is hardly done justice to, though it is clearly sketched in two pen views (1233) and (1241). One of the best drawings in the gallery is that of the Chantry Bridge at Rotherham (1296), in which Sir Reginald Blomfield has presented something of the interest and charm of old works. Another well illustrated subject is the excellent group of L.C.C. buildings on the Kennings estate by Mr. G. Topham Forrest.

We have referred above to several of the more noticeable subjects, and ch in reference to the way in w they have received their illustr exposition. This by no means hausts the lists of exhibits w call for mention. There is, for inst the banking hall in the new b ing at Doncaster (1238) for the West ster Bank by Messrs. Brierley and Ru ford, illustrated in colour, with y toned walls and red columns, whic a whole, is probably much darker in than here suggested. The same a tects, in collaboration with Messrs. Boardman and Son, of Norwich, hav exterior coloured view of a bank bui at Norwich (1266): it would perha easier to be more original than to a better bank building. There is unacceptable change from tradit types in the St. Katherine Colman H by Mr. E. G. W. Souster (façad Messrs. Collcutt and Hamp), a m chrome elevation (1389) showing clever treatment of roof and details. tinted view (1382) of the new o which are being built for the Lo Electric Railways at Queen Anne's has a somewhat laboured and h effect. The large model abov elucidates the scheme by the a tects, Messrs. Adams, Holden and son. The plan, which has ways radi from a central block, will probably a better effect of light and air than with interior courts. It is all uncon misingly square and severe, but will some picturesque values, probably, u the wonderful effects of a London a sphere. One of the most intere drawings is the coloured view (1399) well-designed group of flats on the hall estate, Clapham, by Messrs. I Soissons and G. G. Wornum. The iecting brick balcony above the se floor is an effective feature, and the a tuation of features in the whole fro quite pleasing. Photographs and e tions of the Egyptian State Telegraph Telephone building at Cairo, by Maurice Lyon, fill a good-sized frame the result is somewhat dull. Two t elevations show Mr. Arnold Mitch two designs for Messrs. Cook's buil in Berkeley-street, and suggest economy has been too rigidly exer in the executed work. The new Phy Laboratory at Teddington, by Mr. A. Llewellyn, is unfortunate in its illustrations (1254-5). When the new mises in Henrietta-street (1246) Messrs. Gibson and Gordon are pleted, Messrs. Debenham will have of the finest stores in London. It pity that the point of view for the tion of Messrs. Stagg and Russell's mises in Leicester Square (1244) was taken so as to show what is one o most successful efforts in Londo brighten our street architecture. general colour effect with the brig coloured porcelain ends is excellent. architects, Messrs. Whinney, Son. Austen Hall, are to be congratulate their success. The delicate tinted (1240) hardly does justice to Messrs. head and Ramsey's Worthing Pavil

Amongst the larger buildings are Middlesex Hospital by Mr. Alner W. a tinted view of the courtyard (1234)— School of Pathology, Cambridge Un sity by Mr. Edward Warren, a tinted of a comfortable looking red brick b ing (1261)—illustrations of the R College, Singapore, by Messrs. Farey Dawbarn, effective coloured views Northern Parliament House, Belfast Mr. Arnold Thornely, a good traditi type of Renaissance (1274)—Unive

OYAL ACADEMY EXHIBITION, 1927.

Lloyds Bank, Richmond.

MR. HORACE FIELD, F.R.I.B.A., Architect,

College, Dublin, by Mr. Rudolph M. Butler, a quiet grey drawing in a Greek type of well-balanced Renaissance (1291) – Stratton House, Piccadilly, by Mr. W. Curtis Green, a square-proportioned front which shows the difficulty of design for flats with small heights for rooms (1302)—Secondary School for Girls at Gravesend, by Mr. Wilfrid H. Robinson, a quite nice red brick building (1303)—Stuart House, Cambridge, a Georgian building, by Messrs. Geo. Hubbard and Son (1304)—a perspective sketch (1305) of a corner of the Bournemouth Pavilion, by Messrs. Home and Knight—new school at Cooden, a good school building, by Messrs. Kieffer and Fleming (1320)—proposed school Seymour Place (1403), by E. B. Webber—an entrance for the Woolwich War Memorial Hospital, by Messrs. Pite, Son and Fairweather, not very well shown (1375)—Coulsdon and Purley Municipal Buildings (1379) by Messrs Nicholls and Hughes—the Missionary Guest Houses, Selly Oak, a pen sketch nicely illustrating an excellent building by Prof. Beresford Pite (1384)—new offices at Manchester, a rather imposing pile (1393), by Mr. Henry S. Fairhurst. The Rhodes House, Oxford, by Sir Herbert Baker, A.R.A., is an interesting design, but the clever perspective view rather fogs the design than helps to explain it (1288).

Amongst the exhibits of domestic work we miss some of the more interesting examples of other years, though there are a number which help to uphold the credit of our domestic art. We are not surprised to find one of the best things, a charming little water colour of a gabled house (1239) by Messrs Baillie Scott and Beresford, hung so that it cannot be seen with comfort, and is liable to be overlooked altogether. Such an excellent subject, and where the design and its representation are so really in sympathy, is something of a rarity; the drawing alone would be worth showing as an example of water-colour drawing, but its charm does not come between us and the design of the house, but really expresses it. An unusual subject nowadays is the Gothic hall of Nymans at Handcross, Sussex, by Mr. Walter Tapper, A.R.A., the interior (1321) and the exterior (1326): it is rather pleasant to find a desire for our characteristic English Gothic still alive. The House at Hawkhurst (1249) is the only house design by Mr. E. Guy Dawber. Amongst other domestic work will be noted 1311, by Mr. Eadred J. T. Lutyens, 1228 by Mr. P. D. Hepworth, 1236 by Mr. Maufe, 1248 by Messrs Pite, Son and Fairweather, 1252 by Mr. Poulter, 1256 by Messrs. Lowry and Woodhouse, 1259 by Mr. Oliver Hill, 1283 by Mr. H. Lidbetter, 1290 and 1300 by Mr. C. G. Blomfield, 1315 by Mr. Wontner-Smith, 1323 by Prof. Beresford Pite (a subject that is good enough to be an old design), 1328 by Messrs. Forsyth and Maule, 1380 by Mr. Arnold Mitchell, 1317 by Mr. Harding Thompson (a pleasant group of village buildings).

The ecclesiastical work includes an interesting subject by Sir Giles Scott in his Catholic Church at Ashford, exterior and interior (1329 and 1338): the interior suggests the side walls incline inwards at the top, or is this a hint from Mr. Goodyear? The lofty narrow nave may be taken as a symbol of aspiration, and we should certainly call it a worshipful interior. Sir Robt. Lorimer's Stowe Chapel is well illustrated (1237), and will have a certain dignity, but we prefer his exceedingly able Gothic work to this.

SCULPTURE AT THE ROYAL ACADEMY, 1927

BY T. P. BENNETT, F.R.I.B.A.

An examination of the sculpture at the Royal Academy this year leaves the impression that real vitality is at last appearing in the plastic art of this country. In no recent year has the work exhibited shown so diverse a character, such differences of technique and finish, nor have there been examples of so many different materials, each handled in a way which suggests real appreciation of its qualities. This applies to the purely imaginative group, to monumental work and to portraiture, while the number of pieces in which the sculptor appears to be satisfied with the achievement of moderate skill in technique without imagination or originality has appreciably decreased.

It is unfortunate that in such a year the Royal Academy authorities should have set out the rooms in a manner which is devoid of any real attempt at proper display. This particularly applies to the Lecture Room, where the arrangement is so bad that it can hardly be dignified by any suggestion that it has been consciously "arranged." There is no attempt at grouping, the walls are left in a bare and unfinished condition, and, generally speaking, the least possible assistance has been given to the men who have achieved the distinction of becoming exhibitors. This deplorable result indicates the need for giving much more scope to the architect and sculptor members of the R.A. Council, amongst whom it must be possible to find a man who can give reasonal arrangement to a very fine collection of sculpture.

ROYAL ACADEMY EXHIBITION, 1927.

"Chanson Triste" Relief.

BY ALFRED BUXTON.

There is a considerable amount of work in which the figure and drapery have been conventionalised to a degree which makes the result that of an architectural character, and, therefore, of particular interest to architects. In the Central Hall there is "The Balance," a model of a figure for the National Provincial Bank of England at Cardiff. It is the work of J. A. Stevenson, and is executed in green bronze of an extremely attractive colour and a very fine patina. It represents a draped female figure holding a balance of Egyptian character horizontally across the breast. It has the atmosphere of Greek work, yet secures the effect of modernity, and justifies description as a work of great interest and considerable power, and should look extremely attractive in the right type of architectural setting.

A work of a totally different character is the "Little Apple," a group in stone by Henry A. Poole. This is a three-quarter length of a woman clasping a small child closely to her. The drapery is treated in flat planes and emphasises the general swing of the group, focusing attention in an excellent manner, and giving quite exceptional balance to the whole. There is a fine sense of handling in the method of finish, and the conception is both original and interesting.

In "Man and Woman," a group in stone by Charles Wheeler, there is an example in the ultra modern manner of the male and female torso, treating the outlines and the general modelling of the sculpture in such a way that they immediately arrest attention and strike a note which is new and not unattractive Again the material is very ably handled and well expressed in the finished work.

In the same architectural category must be placed Reid Dick's "The Child," although it is actually a statuette and not, therefore, presumably intended for an architectural setting. It is executed in stone, exhibited in a side view showing a particularly well-balanced composition where the treatment of the general lines of the figure and of the drapery are excellent examples of imaginative composition.

It is difficult to see why space was given to the large "Recumbent Effigy" in marble, monument to Henry Cust at Belton, which has no composition, no architectural character, and is finished in a particularly unpleasant type of gold having nothing to recommend it in colour, texture, or any other quality.

Of the lighter works the large group by Chas. S. Jagger called "Garden Group" is worthy of attention. It represents a satyr on a pedestal with a girl standing in front holding up her lips for a kiss. There is a spontaneous atmosphere of youth about this group which is altogether excellent, and is extremely suitable for garden work. It has managed to achieve wonderfully vigorous vitality, and seems to have completely captured the spirit of "joie de vivre."

Many other works are worth notice; there is "King Robert of Sicily," by George H. Paulin, a seated male figure in white marble with a monkey on its knee, which is very finely conceived and well modelled and achieves a large amount of interest both in subject and treatment. "The Return from the Chase," by Chas. L. J. Doman, is a green bronze garden figure of very good colour treated decorative and suitable manner. half figure of Chas. Jagger by Lady Forres is good in composition, ge handling, texture and colour, but its ness to the sitter might have improved. The garden figure in Ha Wood stone, by Thomas J. Clapperto a fine piece of carving in simple pla

The statue to be erected at Llandu the late Archdeacon Buckley must b of the finest works of Sir W. Gosc John. It is vigorous and character well modelled, and in addition to its fine qualities achieves distinction being executed in bronze with a cu whitish green finish, achieving original and very satisfying effect. standard of the setting equals that o figure, this monument should be a fine piece of work. "The Thrall," Hermon Cawthra, is a well mod figure of sculpturesque effect, displa conscientious workmanship. It is cuted in dark green bronze.

There are many good "heads," var from the purely naturalistic treatme extremely conventional handling. best of these are "Joan," by Albert "The Levite," a powerful exampl modelling in concrete, by F. Doyle Jo "Lola," a bust by W. Reid I Beatrice," by Cecil Gunthorp; "A by E. Whitney-Smith, and a portrait by M. J. Morahan.

There are also a number of statu which have a considerable amou interest, while particular attention sh be given to the "Mask," in g pottery, by Gilbert Bayes. It is very in colour and in general treatment, has distinction and attraction r achieved in glazed ware. Mr. Ba statuette, "England," is also a wo real accomplishment.

There are only a few reliefs in

The Royal Academy.

,—Your reference in last week's issue HE Builder to the honour somewhat y bestowed upon Mr. Guy Dawber, s how inappreciative the Royal Academy e. As a well-known Academician once ked: "The house beautiful is the goal ir ambitions." This pertinent saying be true of those artists who have shot bolt, but it does not apply to those who believe in their powers. The fact ns, however, that architecture, the ss of the arts, suffers from inadequate entation within the charmed and ive circle. It might be argued that honours, more feathers, implies greater nsibility, but all the same there are irds outside the cage not unwilling to nside. The Royal Academy, an enth-century institution, in no way ents the vast circle of artistic endeavour esent in this country. Meanwhile, the jeth century is advancing towards ful middle age; new ideas and new ds are slowly ousting conservative ions, which latter are beautifully tic, yet banefully harmful. The micians are apt in their longevity to the claims of their juniors, and stand- ecure on their limited plot seek to e the efforts of others. Is it not some- anomalous that 10,000 practising archi- tects should have but ten representatives at the Royal Academy. No one in Scotland believes any of the members of this Knighthood of Art to be a man in a thousand. As you hinted in your notes, there are at least a score of British architects whose work merits recognition before they leave this world for the next. Angus Maconichie.

Glasgow, N.B.

Architecture at the Royal Scottish Academy.

Sir,—Your reviewer says with reference to the designs for the coloured cement roundels at the Aquarium that "they suggest rather mosaic or cloisonne than cement." The process is, in fact, exactly that of the latter if champleve be substituted for cloisonne. The Atlas white cement ground is first laid down over the whole surface, the main masses of the design are then cut out and filled with the same material in different colours, leaving the intervening lines and spaces of white to contour and outline the pattern. The remark is a small one to cavil at, but this explanation seems to be due in justice to Mr. Thos. Beattie, the craftsman who some time ago introduced and has now developed with extremely satisfactory results this method of decoration.

The Designer.

The Registration Bill and Engineers.

Sir,—The letter in *The Builder* of April 15th under this title is interesting, since it is one more illustration of the long way certain architectural assistants and official architects have yet to travel before admitting the obvious remedy for their grievances. It is illogical for such members to talk of being overlooked and over-ridden by engineers, etc., of being "loyal subscribing members" of professional institutes such as the R.I.B.A., and ignore the fact that by holding aloof from the organised salaried section of their colleagues they are preventing such organisation from winning them a status commensuate with their work and abilities. Do they expect those members of the R.I.B.A. or any other such body, and employers such as local authorities, etc., an important part of whose interests is opposed to those architectural assistants, to win for them the rights your correspondent desires? He is lacking in knowledge of human nature if he thinks they will do so. Architectural assistants, like all other sections of the community, will have to organise as such, and by dogged perseverance and pluck win the rights and privileges they so ardently desire. A start in this direction has been made, and the progress of the Association I refer to has been remarkable.

ILLUSTRATIONS

Proposed Catholic Church, Ashford, Middlesex.

This church is to be built upon an open and level site. The design is Romanesque in character. The walls will be faced externally with Dutch bricks, and plastered internally with dressings of brown Hornton stone. There will be an open timber roof, decorated in colour. This roof will be covered externally with special Italian tiles. The church will consist of nave and sanctuary of lofty proportions, with transepts forming chapels. Over the southern chapel will rise the tower. The nave will have aisles, which will be used for processional purposes only and not for seating. There will be a gallery over the western bay of the nave. The main entrance will be by a porch at the south-west angle of the building. This porch will balance the baptistry at the north-west corner. A distinctive feature of the interior will be the unusual height of the sanctuary floor above the nave floor, an arrangement which will enable the sacristies to be accommodated under the sanctuary.

Sir Giles Gilbert Scott, R.A., F.R.I.B.A., is the architect.

The Army and Navy Stores.

Owing to the fact that this building is being remodelled in sections, and not rebuilt, the old window spacings and floor levels have had to be retained. This has naturally affected the design, the first section of which is now being carried out in red brick and Portland stone. The total length of the frontage is 341 feet, and the height 80 feet to the top of the cornice. The plain frieze under the cornice, upon the effect of which the design largely depends, masks the restaurant, stock rooms, etc., all of which can be top lighted. Messrs. Dove Brothers are the contractors for the present sections, and Mr. F. Comport the clerk-of-works.

Sir Aston Webb and Son are the architects.

New Premises—Fenchurch-street, E.C.

This building, now in course of erection, occupies the site on which formerly stood the Church of St. Katherine Coleman. It is designed for the purpose of letting as offices. The two principal elevations are being carried out in hand-made brick with wide joints, the dressings being in artificial stone. The roof is to be covered with hand-made sand-faced Roman tiles. The windows are to be in deal painted. The general contractors for the work are Messrs. Minters, of Putney, and the models for the stone enrichments are being prepared by Mr. P. G. Bentham, of Gunter-grove, Fulham, S.W.

The architect for the building owner is Mr. E. G. W. Souster, F.R.I.B.A., of 3, St. James's-street, S.W.1, but the two principal facades shown in the drawing have been designed by Mr. Stanley Hamp, F.R.I.B.A. (Collcutt and Hamp), of 120, Wigmore-street, W.1, as consulting architect.

Department of Anthropology, University College.

The proposed Department of Anthropology, plans of which are in preparation, is intended to form an extensive adjunct to University College. The new buildings have been schemed to provide accommodation for the following departments—zoology, psychology, archæology and anthropology; in fact, they will form a branch of the college which will accommodate all research that pertains to the history of mankind. The plan is a quadrangle, the chief features being the five theatres at the ground level, two on either side and the central one for general use On the first floor are grouped the museums and libraries.

Messrs. Richardson and Gill, FF.R.I.B.A., are the architects.

New Headquarters, Lloyds Bank, Ltd.

The new building for Messrs. Lloyds Bank, Ltd., now in the course of erection, will occupy a fan-shaped site with frontages to Cornhill and Lombard-street, of 146 ft. and 198 ft. respectively, and will house both the Head Office department and the City Office. The accommodation, apart from the basements, will be provided in eight stories above the street level, the ground floor and the mezzanine floor immediately above being devoted to the City Office, the remainder being allocated to the Head Office. The structure will be of steel-framed construction, and the main fronts are to be faced with Portland stone with granite plinths, window jambs, and keystones to the ground floor arcaded story. The entrance doors are to be of bronze enclosed in a marble surround, and the infilling of the arched window openings will also be of bronze. The banking hall on the ground floor, which is planned on an axial line equidistant from both sloping fronts, will be finished with marble wall linings, columns, floor and counter, the latter enclosed with metal grilles. The contractors for the work are Messrs. Trollope and Colls.

The architects are Sir John Burnet and Partners and Messrs. Campbell Jones, Sons, and Smithers, with Dr. Oscar Faber acting as structural engineer. (Other views of this building were given in our issue for January 14, 1927.)

New Underground Railway Offices, Westminster.

The plan of these new buildings is cruciform. The central hall, lifts, staircases and lavatories will occupy the central tower, the wings being given up to office space. The booking hall of St. James' Park station will occupy the ground floor of the north wing. The building will be of steel-framed construction, faced throughout with Portland stone. A feature in the plans is the absence of internal lighting areas.

Messrs. Adams, Holden and Pearson, F F.R.I.B.A., are the architects.

Lloyds Bank, Richmond.

This building has a Portland stone front elevation, with 2 in. red brick facings. The floors are of steel and concrete. The flats are of Ferrocrete cement-concrete and steel filler joists. There is a tiled roof to front and asphalt flats at the rear. The main contractors are Messrs. E. A. Roome and Co., Ltd., Crown Works, Urswick Road, Hackney, E.9, and the following are sub-contractors: Henry Hope and Sons, Ltd., heating and ventilation; Duncan, Watson and Co., electric lighting and bells; C. E. Welstead, Ltd., iron casements; Ratner Safe Co., Ltd., Bromley-by-Bow, strong room door and fittings; Young and Co., steelwork; Herbert Morris, Ltd., Loughborough, Lifts.

The architect is Horace Field, F.R.I.B.A., 5, Gower Street. W.C.1.

New Boys' Hostel—Lord Wandsworth Orphanage.

This institution is an agricultural college for orphan boys. The new building in course of erection provides accommodation for 40 boys, with rooms for matron and master and staff. The walls are being faced with Messrs. Collier's multi-coloured bri and the roofs covered with sand-faced h made tiles, by Messrs. Ames and Fir The stonework to the entrance is in D ing stone. The drawing shows the r entrance only, but the building is an ex sive one, having four separate wings, containing dormitories, one cubicles and other for the service staff.

Mr. E. Guy Dawber, A.R.A., P.R.I.B is the architect.

Hyam, Malmesbury, Wilts.

Hyam Park Farm, near Malmesbury, typical Wiltshire stone farmhouse, stabling, cow-houses, barn and walled yard. The house has already been alt and improved, and now further exten and adaptations are being undertaken to plete its transformation into a small cou house. The old stockyard and cow-h are being converted into hunting sta and the open yard and cow byres eventually become a garden court wit cloistered walk.

Messrs. Forsyth and Maule, FF.R.I.B are the architects.

New Premises at Doncaster for th Westminster Bank, Ltd.

These important banking premises, which an exterior view and description published in THE BUILDER on May 22, 1 are now approaching completion. The b ing hall, of which a view is now publis consists of a large central area, 90 ft. l 45 ft. wide and 45 ft. high. In this s are arranged the counters, desks, etc. which the business of the bank is conduc On each of the principal sides is an a separated from the central area by a co nade. The ceiling and other decora features are of fibrous plaster, and the p are finished in Parian cement. The f is of Nabresina marble, with cappings plinth of Belgian fossil. The counters desks will be constructed of mahogany, the floor covered with rubber paving.

The general contractors are Messrs. J Wright and Sons, of Leeds, and the fol ing are sub-contractors: G. and A. Br decorative plaster work; Fenning and marble work; Waring, Withers and C wick, electrical installation; Waygood- bullion lift; Wm. Bellerby, Ltd., Y counter and other fittings; Northern Ru Co., of Retford, rubber paving; N. F. I say and Co., Newcastle and London, br book racks and light standards for desk

The architects are Messrs. Brierley Rutherford, of York.

The Chantry Bridge, Rotherham.

The new bridge at Rotherham has planned to obviate the difficult cro afforded by the mediæval bridge, while a same time preserving the old Chantry Ch unaltered. It was therefore decided to r part of the old bridge adjoining the Cha as a footway, connected with the new br The new bridge is in one span of a 94 feet, in reinforced concrete, 60 feet between parapets. The latter are in s to harmonise with the old stonework, the face of reinforced concrete (of a brown colour) is finished with a fine gr face. The new bridge, and alterations to old bridge, have been designed by Reginald Blomfield, R.A., Litt.D., in laboration with Mr. Vincent Tu A.M.Inst.C.E., Borough Engineer Rotherham.

ILLUSTRATIONS

(*Continued from p.* 722.)

view over the Green Park looking south, the east front to Stratton-street and the west overlooking Bolton-street. The ground floor will be used for banking and business purposes, and the whole of the upper floors will be built as flats having large airy rooms, many of them with balconies and with an unusual number of bed and bath rooms. The plant for heating, hot and cold water supply, etc., will be arranged in a sub-basement. The flats will be built of fireproof construction throughout, with central heating on the panel system, in addition to open fireplaces and electric fires, and the modern systems of gas and electric cooking arrangements. The elevations of the building will be in Portland stone.

Mr. W. Curtis Green, A.R.A., is the architect, and the builders Messrs. Holloway Bros. (London), Ltd.

First Church of Christ, Scientist, Bromley.

The site for this church is a corner one, and the building is situated so that it will be seen from all sides. The plan adopted is semi-octagonal, with small wings on the cardinal sides. The whole of the administrative offices, cloakrooms, foyers, etc., are provided around the audience hall and to be treated externally as a base for the main structure. The Sunday-school wing is a subordinate feature, to form an anti-climax to the design. The audience hall provides seating for 500 persons and the Sunday-school for 250 children, with five classrooms. The chief building material is 2 in. hand-made bricks, in multi-coloured greys and light reds. The design depends entirely for its interest on the handling and treatment of the brick work, and all the classical details are worked out with tiles and brick courses to provide the necessary proportions of the various features. The roof is a flat, of concrete, steel and asphalt, and the interior is finished with a plaster star-shaped panel ceiling. The floor of the audience hall has a slight slope of 1 in 15 towards the platform, and is to be covered with cork parquet flooring. French stone of the Hopton Wood variety is to be employed for the main entrance steps and approach, and for dados, skirtings and entrance furnishings. The contractors carrying out the work are Messrs. T. H. Adamson and Sons, of Putney, and the complete contract of the church building without the Sunday-school amounts to £18,045.

Mr. W. Braxton Sinclair, F.R.I.B.A., is the architect.

School of Pathology, Cambridge.

This building is now being erected on a site in Tennis Court Road, for the University of Cambridge, the architect being Mr. Edward Warren, F.S.A., F.R.I.B.A. Its purpose is essentially scientific, and accommodation is provided on the ground floor for research rooms, chemical laboratory, X-ray room, micro-photography, cold store, centrifuges, instrument room, etc., a classroom, also boiler room, fuel stores and lavatories; the centre bay contains the staircase, and an electric goods lift is provided. On the first floor a large classroom occupies the whole of the north-west wing; the centre block contains research and other rooms, while the north-east wing contains both a small and a large lecture theatre and a museum. The second and third floors contain research rooms and other specialist departments, the library being on the second floor. The external walls are faced with Messrs. S. and E. Collier's selected dark "Old English" hand-made facing bricks $2\frac{3}{8}$ in. thick. The entire main cornice is of specially moulded brickwork, together with the cills and plinth. The rusticated quoins and arches, etc., are picked out in selected red coloured brickwork. The stonework to the several features, such as entrance doorways, keystones to arches over windows, parapet coping, etc., is in Clipsham stone. The building is covered with an asphalt flat, upon which are various skylights for lighting and ventilation. The floors and staircase are of reinforced concrete throughout. The general contractors are Messrs. Coulson and Son, of Cambridge, and the following are sub-contractors: Diespeker and Co., Ltd., reinforced concrete; A. D. Dawnay and Sons, Ltd., steelwork; John H. Fye, metal casements; Penrose Lifts, Ltd., lift; Rosser and Russell, Ltd., heating and hot water supplies.

Cinema at Fulham.

This cinema is designed to hold 2,000 persons. It is fan-shaped on plan, so as to secure the maximum number superior (*i.e.*, far-back) seats. There will be practically no modelled ornament inside, but "atmospheric" decoration, as in certain recent American examples. The materials will be brindled facing bricks, "tapidorous" dressings and columns, and dark-blue glazed pantiles. There will be a great gilt-barred window in the porch with green and magenta curtains within and lemon-coloured lighting in the foyer.

Mr. Clough Williams-Ellis is the architect.

Other Illustrations.

We also illustrate this week the following R.A. drawings:—Church of St. Mary and St. Thomas, Gorton, Manchester (Mr. Walter Tapper, A.R.A., architect), and New House at St. John's Wood (Mr. Edgar Ranger, architect).

SOCIETIES AND INSTITUTIONS

LEEDS AND WEST YORKSHIRE ARCHITECTURAL SOCIETY.

The 51st annual meeting of this society was held recently at Leeds. The society has a membership of 258, including honorary members. The following officers and Council were elected for the session 1927-28:—

President: Col. Albert E. Kirk, O.B.E., A.R.I.B.A.

Vice-Presidents: Victor Bain, A.R.I.B.A., F. L. Charlton, A.R.I.B.A.

Hon Treasurer: Wm. Whitehead. A.R.I.B.A

Hon. Librarian: F. W. H. Allison, A.R.I.B.A.

Hon. Secretary and Representative R.I.B.A. Council: T. Butler Wilson, F.R.I.B.A.

Members of Council: Douglas Bowman. Norman Culley, F.R.I.B.A., J. E. Stocks, J. F. Walsh, F.R.I.B.A., G. H. Foggitt, A.R.I.B.A., A.R.C.A., Joseph Addison, M.C., A.R.I.B.A.

MIDLAND TOWN-PLANNING COUNCIL.

At the annual meeting of the Midland Joint Town-Planning Advisory Council, at the Birmingham Council House, on April 28, Alderman Talbot (Birmingham) was re-elected chairman and Mr. H. H. Humphries, honorary surveyor. The report of the General Purposes Committee was presented by Alderman Kenrick (West Bromwich), and approved. Councillor Brassington submitted the joint report of the Regional Survey and Arterial Roads Committees, which was approved, and the report of the Finance Committee was also adopted. A report was received in relation to the railway bridge over Alvechurch-road, near Barnt Green Station. Correspondence has taken place with the L.M. and S. Railway Company, the Ministry of Transport, and other authorities, with a view to the provision of a bridge of greater span, but the negotiations have not succeeded, and the bridge is now being reconstructed in accordance with the provisions of the Railway Company's Bill, namely, 25 feet in span. Indicating suitable lines of arterial roads of the future within the regional area, the committee mentions adaptations of existing main, secondary, and district roads from Coventry to Stourbridge, Coventry to Worcester, Leicester to Worcester, East Birmingham to Leicester.

SOCIETY FOR PROTECTION O ANCIENT BUILDINGS.

The Lord Mayor presided at the Mans House over the 50th annual meeting of Society for the Protection of Ancient Bu ings.

Lord Crawford, in moving the adopt of the report, said that the meeting ma a special occasion, for it was their 5 anniversary. The principles upon which society was founded were based on exp ence and common-sense and on those g ideals which must appeal to all who proud of their native land and its achi ments. Half a century ago destructio our English buildings was proceeding an appalling speed. They had only to at topographical maps and prints of t period to realise what a wealth of old struction the country possessed of wh we were now deprived. Then, too, the pair of old buildings, when necessary, carried out in a most careless and perf tory fashion. They were injured, soph cated, disfigured and destroyed in the cess. It was always thought justifiable make a forgery of some original style order to make a new building coalesce harmonise with the old. We were faced with many of the dangers and culties which prevailed then.

For 50 years the society had been pr ing its aims with great activity, and c look back over the period with a sens satisfaction that principles laid down ha century ago were now accepted all over country and, indeed, all over Europe well. We had led the world in the of repair and conservation. It was uni sally recognised that, where a building disrepair was to be strengthened in c that it might continue to fulfil its mis for future ages, the work, when carried on the principles laid down by the soci was better done here than anywhere in Europe. He could say with confid that the methods of the Office of W were in the direction of sacrificing not of old work.

Sir Hugh Bell seconded the motion, w was carried unanimously.

The Lord Mayor said London posse little to show for its 2,000 years of kn history. There was still a part of the Ro wall built in the fourth century, but the long succession of buildings betv that time and the Great Fire in 1666 t was an inadequate representation—only Tower, St. Bartholomew's, Smithfield, the crypt of Bow Church. In the l part of the last century ten of Wi churches were destroyed. That others, cently threatened, had been saved was that the ideals of the society were inc ingly acceptable to public opinion.

ARCHITECTURAL ASSOCIATION (IRELAND.

The Architectural Association of Irel meeting on April 25 at 8, Merrion-sq Dublin, had before it the report for session 1926-1927, which stated that record of the year's work was very s factory, and that 21 new members had elected during the session, making a of 155. The Downes Bronze Medal awarded to Captain Henderson, and Architectural Association Prize to Mr Carberry.

Mr. Sedgwick Keatinge, in the cours his valedictory address, said that there one thing that he would like to sa those architects who had pupils in offices who were attending the studio the lectures at the National University, that was that this system of training stu was the best method by far that the A tectural Association of Ireland had taker However, to be a success the students attend at the University regularly, an asked the members to make it possibl their apprentices to leave their offices at hours laid down in the programme, not for the good of the student but for the of the Architectural Association. If numbers were not kept up at the Unive the old class system would have to be sumed.

wing are notes from the minutes of ncil for April 11th:—

Royal Gold Medal.—The Council tormed that the King had approved ard of the Royal Gold Medal to Sir t Baker, A.R.A.

Registration Bill.—The result of the on the Second Reading of the ation Bill in the House of Commons mally reported to the Council, who a very hearty vote of thanks to Sir t Kinloch-Cooke and the chairman embers of the Registration Com-

Preservation of Old Bridges.—On ommendation of the Art Standing tee a grant of £100 was made to the . Special Bridges Fund

on "The Moorish Architecture of Africa."—It was decided to invite thur J. Davis to read a paper on Moorish Architecture of North this session.

Bath Corporation Act, 1925.—It was to print Clause 128 of the Bath tion Act, known as the "Bath " in the journal for the information bers.

al Service for Art in Westminster —It was decided to give the cordial of the Institute to the arrange- nade by the Royal Academy for the of an annual service for art at nster Abbey.

of Danish Architects.—Permission use of the galleries was granted to hitectural Association for the dance eld on May 27th, in honour of the architects visiting England. It was ided to invite the Danish architects the President and Council at the on of Modern British Architecture.

ination Results.—The Board of tural Education reported the fol- results:—

Special Examination. Singapore: ed, 1; passed, 1; relegated, 0.
Intermediate and Final Examina- Cape Town: The Intermediate ation: Examined, 5; passed, 3; l, 2. The Final Examination: ed, 2; passed, 2; relegated, 0.

f Examinations recognised for the nership.—It was decided to make and geography alternative subjects list of subjects required to be by the certificates recognised for bationership.

School of Architecture. Leicester f Arts and Crafts.—Recognition for n from the R.I.B.A. Intermediate tion, under the usual conditions, nted to this school for its three ll-time day course.

ictory Scholarship, 1926-1927 *Com*—It was decided to grant a Cer- f Honourable Mention to the author of the drawings submitted under the motto "Sea."

Presentation of Prizes at the R.I.B.A.—It was decided to institute certificates to be presented to the following prize-winners at the annual presentation of prizes:—R.I.B.A. (Henry Jarvis) Student (British School at Rome). R.I.B.A. (Archibald Dawnay) Scholars. R.I.B.A. (Anderson and Webb) Scholar at Cambridge University School of Architecture. R.I.B.A. (Henry Jarvis) Student at the Architectural Association. R.I.B.A. (Howard Colls) Travelling Student at the Architectural Association. R.I.B.A. Donaldson Medallist at the Bartlett School of Architecture, University of London.

The Arthur Cates Prize.—It was decided to approve the proposal of the Charity Commissioners that the amended scheme for the Arthur Cates Prize should provide for the offer of an annual prize for the Promotion of the Study of Architecture, more especially in relation to the application of geometry to vaulting, etc. (*i.e.*, the object especially indicated by the founder), with a proviso that if in any year (either owing to absence of competitors or the fact that no work of sufficient merit is submitted) no prize is awarded, then the following year the prize shall be offered in connection with some other architectural subject, *e.g.*, town planning. The scheme would further provide that the income of the charity unexpended in any year should be added to the capital endowment, so that the value of the annual prize might ultimately be augmented.

The R.I.B.A. (Henry Saxon Snell) Prize.—It was decided to amalgamate the R.I.B.A. (Henry Saxon Snell) Prize with that offered by the Architectural Association, and to institute a Henry Saxon Snell Scholarship, to be offered every third year, and administered by a Joint Committee of the R.I.B.A. and the Architectural Association, the income of the two funds being amalgamated for the purpose of providing the Scholarship Fund. The Council of the Architectural Association have agreed to this proposal.

Constitution of the Board of Architectural Education.—The officers of the Board of Architectural Education for the ensuing session were appointed as follows:—Chairman, Mr. Henry M. Fletcher; Vice-Chairmen, Mr. L. Sylvester Sullivan, Chairman of Examinations Committee; Mr. Howard Robertson, Chairman of Schools Committee; Mr. Robert Atkinson, Chairman of Prizes and Scholarships Committee; Mr. W. H. Ansell, Hon. Secretary.

It was decided that the two Past-Chairmen serving immediately prior to the present Chairman should be ex-officio members of the Board.

The Victory Scholarship Medal.—It was decided to institute a medal, to be awarded with the Victory Scholarship, in commemoration of members of the Society of Architects who fell in the War. A selection of esquisse designs for the medal has been obtained from the recognised Schools of Architecture, and that prepared by Mr. E. B. O'Rorke, of the Architectural Association School of Architecture, has been selected as most suitable. The generous offer of a former member of the Society of Architects to defray the cost of making the dies for the medal has been accepted.

Lectures on Architecture for Workers in the Building Trades.—The Board reported that in accordance with the suggestion approved by the Council on April 19th, 1926, they have held two series of lectures on architecture for workers in the building trades. During the discussions the following points were brought out:—

(1) That more interest would be taken by the craftsmen in the buildings upon which they were engaged if models of the proposed buildings were placed upon the works for their inspection while the buildings were in progress, and that complete plans and drawings might be available in order that the men could see how the work they were doing fitted into the whole structure.
(2) That craftsmen should be given more liberty to use their discretion in the execution of their particular crafts.
(3) That the architect and craftsman should get into closer personal touch with each other.
(4) That architects might take building apprentices over their works while in progress, and at completion.

It was decided to approve the recommendation of the Board that steps should be taken to bring the above desires to the notice of all practising architects.

Committee on Standard Methods of Testing Small Clear Specimens of Timber.—Mr. E. H. Evans, F.R.I.B.A., was appointed as the R.I.B.A. representative on a new committee set up by the British Engineering Standards Association, to undertake the standardisation of methods of testing small clear specimens of timber.

London Building Acts Committee.—Mr. Louis D. Blanc, L.R.I.B.A., was appointed as an additional member of the London Building Acts Committee

Forms for the Appointment of Arbitrators.—On the recommendation of the Practice Standing Committee, it was decided to adopt, for future use, two forms for the appointment of arbitrators, one form to be used when the dispute is a general one, and no agreement has been made for submission to arbitration, and the other form when the dispute arises under a building contract wherein there is a submission to arbitration.

R.I.B.A. Scale of Charges.—It was decided, on the recommendation of the Practice Standing Committee, that in future a loose slip should be inserted in each copy of the Scale of Charges sent out by the Institute, intimating that members are advised to take the earliest opportunity of bringing the scale to the notice of their clients

Studentship.—The following were elected students of the R.I.B.A.:—Billiards, Harold (Leeds College of Art); Buchanan, James Wardrop (A.A.); Egan, John Edward (Passed Intermediate Examination); Fridjhon, Clement Raymond (Passed Intermediate Examination); Hunt, Henry Arthur (Northern Poly.); Lipp, Alexander (Glasgow School of Architecture); Lloyd, William Raymond (A.A.); McNeil, Patrick (Glasgow School of Architecture); Murray, James Mackie (Edinburgh College of Art); Roxburgh, Charles Wallace (Passed Intermediate Examination); Solomon, David Bowen (University of Liverpool); Westendarp, Rudolf Theodore (A.A.).

Resignation.—The following resignation was accepted with regret:—A. Ernest Lacey, L.R.I.B.A.

Applications for Election as Subscribers.—Two applications were approved.

Applications for Election as Licentiates under Section III. (f) of the Supplemental Charter of 1925.—Three applications were approved.

Maintenance Scholarships in Architecture.

The Maintenance Scholarships Committee announce that they have received a contribution of ten guineas from the Leeds and West Yorkshire Architectural Society towards the Maintenance Scholarships Fund.

The Willett Memorial.

At a recent meeting of the committee of the Willett Memorial Fund, it was reported that of the £12,000 which the committee set out to raise for the purchase of 87 acres of Petts Wood, Chislehurst, as a memorial to Mr. William Willett, the originator of "summer time," about £10,000 has now been obtained. The title deeds are to be handed over to the Public Trustee by Lord Camden on Saturday, May 21.

ROYAL SCOTTISH ACADEMY EXHIBITION

SCULPTURE

By BENVENUTO BRUNELLESCHI.

"It has been well said that no art can be classic which has not been barbaric. The movement of every school of art seems to be through a regular curve."—Lethaby.

"Something is due to the demands of the spirit after the material ones have been satisfied."—H. V. Lanchester.

The sculpture hall at the Royal Scottish Academy is again largely an attractively arranged show of busts, heads and statuettes. There are only five works of any size. With the exception of the work at the Scottish National War Memorial there seems to be little collaboration at present in Scotland between the architect and the sculptor.

This is unfortunate; to be regretted, but easily explained. Economy is the cry of the day, and architects have no choice but to cut out most of the embellishments which in former times were usually and naturally introduced into any work of public or ecclesiastical importance. Again, the system of training our sculptors in great art schools, with substantial travelling scholarships as a reward of industry, has brought about a professional status for the sculptor which has led to his being recognised as an independent artist rather than a collaborating craftsman. It is the trend of this age, and is more or less affecting all walks of life. Freedom of expression is right and good, but in any great combination of the arts in one building, nothing but chaos and confusion can result unless the underlying theme and general composition is controlled by one master mind. This is the more essential to-day when intellect and education have taken the place of tradition and inspiration.

Mr. D. H. Banner in a recent article in the "19th Century Magazine," on "The Decadence of Modern Sculpture," says some interesting and arresting things. One of which is worth quoting. "Modern sculpture absorbs the energies of few men, and not the whole mind of those: it is looked at by few; our feelings turn elsewhere more naturally." It is a laborious art, and only men of the soundest physique could long stand the strain of doing anything but busts and statuettes.

The place of honour in the sculpture hall at the Royal Scottish Academy is occupied by Mr. Alfred F. Hardiman's figure of "Peace," a large draped female figure in bronze. It is treated with an almost Assyrian or Egyptian-like severity and its distinct architectonic qualities give it an impressiveness which is so often lacking in the usual anatomically accurate rendering of the studio model. The symmetric treatment of the drapery and general pose emphasises this quality and the careful and scholarly modelling give this figure a feeling of being designed rather than posed, which is the outstanding requirement for all really fine sculpture. The hands are half uplifted, and the right holds the spray of a palm branch. The head and face are not of the naturalistic order, but may stand for some abstract ideal type of the artist's own. Whether we like the type or not it is justified on the grounds that a mere portrait head of a more or less handsome model would introduce the sensuous element which would lessen the value of the figure as a symbolic representation of "Peace."

"The Spirit of the Streams," by Mr. Gilbert Bayes, is a large female nude which is pleasing in its decorative lines. The figure is half kneeling on the left knee and half sitting with a water lily in the left hand. The lines of two kneeling deer form a decorative background to the right and left, but the decorative and realistic motifs are rather conflicting. In this figure the sensuous element in the face is justified by the title of the subject. It is well modelled and thoroughly realised.

"The Unfolding of Spring," by the same artist, is a large female figure in high relief in marble. It is compactly composed and well designed. She kneels on her left knee, and the head is resting on the right hand which is placed on the right knee. The small frieze of figures carved on the base is classical in feeling, but lacks delicacy of finish, and the scale does not harmonise with the main figure. The introduction of two scales in a work of this nature is a difficult problem, and in modern work rarely achieves the success found in classic and renaissance work.

"Me," by Mr. Percy Portsmouth, is a large nude male. It certainly expresses egotism in the most vulgar sense. He stands with legs apart and arms folded, and his face depicts the smug self-satisfaction of a victorious prize-fighter. The muscular development is somewhat excessive, and the whole aspect bacchanalian.

"King Robert of Sicily," by Mr. G. H. Paulin, is a large nude seated figure with a monkey on his left knee. The figure is well-modelled, but hardly expresses its title in type or treatment.

"Pastoral," by Mr. W. Reid Dick, is one of the most beautiful works in the exhibition. It is a female head carved in Hopton wood stone. It is finely posed and subtly carved, and so restful when seen alongside the swallow's nest technique of some of the other busts.

The "Lily of the Valley," by Mr. P. Macgillivray, is also a female bust of outstanding quality. The pose and subtlety of expression is exquisite and show this artist at his best as a sculptor of noble and charming women. His "Portrait of an Artist" is also a vigorous and fine piece of male portraiture. "Eos," by the same artist, is a nude female statuette seated with left leg over the right.

"The Joy Ride," by Miss Erica Lee, is a spirited and finely balanced group of two young boys playing. One struggling to keep his balance on a mat and the other pulling. It is well composed and accomplished in modelling.

"The Head of Christ," in bronze, by Mr. Alfred F. Hardiman, is tragic in treatment, but unmistakable in subject.

"The Awakening," by Mr. Charles L. Hartwell, is a delicately modelled female nude statuette in bronze.

"The Fox and the Toad," by Miss P. M. Bone, shows a vigorously modelled group for garden sculpture in lead. It possesses those distinctly architectural qualities which we always find in this able animal sculptor's work.

"The Right Hon. J. Ramsay MacDonald, M.P.," by Mr. Jacob Epstein, is a bust of the massive type and of the swallow's nest technique. While being unmistakable as a portrait, it possesses little evidence of insight into the psychology of the sitter. The grim determination of the features lack any trace of culture or intellect.

"A Ghetto Jew" and portrait bust of Mr. J. B. Fergusson, by Mr. Benno Schotz, show great advance in this able artist's technique, and as character studies are excellent.

The late Mr. Fanindra Bose, the clever young Indian Associate, who was trained in Edinburgh and whose work was so notable for its thoroughness and the quality of its finish, is represented by two statuette groups of "Huntsman and Hound" and "The Hunter" in bronze, and a portrait bust in plaster.

Sir W. Goscombe John shows "Evelyn," a bronze female bust finely posed and modelled with subtlety and po charm.

Mr. W. Reid Dick's "Ann" is a de treated study in bronze of a child's

Mr. E. M. Alexander, in his "Tiger" statuette, has achieved a distinction. It is handled in a simple manner, and is no mere tam of a dweller in a Zoo. The lines silhouette are almost Assyrian-like sense of decoration. Mr. Alexande great gift for the handling of anima father, Mr. Robert Alexander, a brother, the late Mr. Edwin Alexand notable as fine painters of animal

"The Autumn Dance," bronze, C. W. Dyson-Smith, is a cleverly statuette of a nude female dancer.

"An Old Salt," by Mr. William is a cleverly modelled head of an ol The character is well preserved in its swallow's nest technique.

"Jane," by Mr. Alfred F. Hardi somewhat weird but subtle.

"Field-Marshal the Earl Rober Mr. John Tweed, is a good portrai

"Cleopatra and the Priest Harn by Mr. Arthur G. Walker, a smal in white marble, has caught somet the Egyptian atmosphere.

"Illusion," bronze statuette by Mr Dyson-Smith, is a finely balance female with a ball of crystal.

Mr. H. S. Gamley is represente portrait bust of Mr. James L. LL.D., of Toronto.

Miss H. Armour has a carved woo called "A Mood," not unlike a self

Mr. A. Carrick shows his portrait lion of the late Lord Pentland, and portrait medallion called "Roy," showing skilful and searching unders of character.

Mr. Birnie Rhind shows a statu "A Miner" and a portrait bust of Daughter of Mrs. J. P. Lees."

"The Boy Scout," bronze statu Sir W. Goscombe John, is well po realistically treated.

Out of 72 exhibits in the sculptu 30 are heads and busts, and most others are of the drawing-room s type. We may assume that the market for this kind of sculpture, is to be regretted that the cleavage architecture seems to widen as the past. No one can very well be bla in the world of art it must be admit what is in a sense inevitable. In effort is of little avail, for, as Letha "We are helpless as individuals wit tide of custom." We are in a measu whelmed by the spirit of our ag socially and economically is over us. In sculpture and painting, as tecture, our life is being reflec crystallised, and posterity will re truly and clearly as we read Pompeii, Mesopotamia, Egypt or t cities to-day.

If the general interest of the people could be awakened, somethi great might be done, for we have m men who might rise to unknown if truly great opportunities were The great mistake so far as war w were concerned was that they wer through before the mind of the na settled down after the war, and t controlled by people who knew about sculpture except the phot kind, with its petrified soldiers a tion wreaths. The money was fritte in little local tombstones, when have been gathered together to counties. The human mind seems little from the lessons of history like opportunity will never occur this generation. One thing is nothing great can ever be acc without a fearless courage and understanding of the relation bet visible and the invisible.

NCIENT HINDU ARCHITECTURE IN JAVA

2.—THE TEMPLES AT KALASAN AND SARI.

By W. ROBERT FORAN, F.R.G.S., F.R.A.I., etc.

URING the ninth and tenth centuries there a settlement of Hindu priests on the Pramn plains, due east of Djokjakarta, and the s of their extensive temple-city now lie tered all over the plains of Prambanan and gedug. They are to-day little more than s, sometimes even meriting the description ubbish-heaps. Moreover, much that half-a-ury ago was seen, described and greatly velled at by early travellers in Java, has rely disappeared. These relics of past skill rchitecture, even seen in the present day, give a notion of the former magnificence his great temple-city, of the highly deped artistic sense of its ancient architects, of the extent of the area occupied by the city. The ruins cover an area of about miles in breadth and nearly eight miles ength. It seems certain that these buildwere commenced during the ninth and h centuries, when the Kingdom of Mataram rished in Central Java; but, most probably, construction work was suspended in the half of the tenth century, and many of monuments obviously were never com-ed.

he temple ruins on the Prambanan Plains far more interesting than those to be found in existence on the Sorogedug Plains, and are somewhat better preserved. On the gedug Plains scarcely anything remains reby one can judge their former splendour general design; for the most part, one can just distinguish the spot where formerly emples had their being.

is not really known what was the cause e decline of the ancient Hindu Kingdom in ral Java, but a connection doubtless exists een that catastrophe and the fact that the les were abandoned before actual comple-

This was certainly the fate of the Pramn group of temples, for instance; for at Prambanan temple, about which more , it is only too patent that the ornamen-n scheme was never carried to its con-on according to the original design of the itects.

Earthquakes have caused these temples on the Prambanan and Sorogedug Plains to tumble down in confused masses of masonry. Without using either cement or mortar, the Hindu architects piled the heavy blocks of stone one upon the other; projections on the stones, fitting into grooves and cavities in the neighbouring ones, had to serve as a binding expedient. With the employment of such a crude method in building, naturally the cohesion of the slabs of stone was easily broken by an earthquake, and the resulting rubble was not unlike the contents of a gigantic "box of bricks" all promiscuously thrown together. Furthermore, the tropical vegetation, which soon commenced to batten upon the forsaken sanctuaries, performed its part in the work of devastation and wrenched apart what little had been spared by the frequent earthquakes. A large portion of such buildings as still stood erect was destroyed in the great earthquake of 1867; and, finally, came man to complete the work of destruction commenced by Nature and the elements. The ruins, which to a layman's eye were nothing but heaps of stones, were regarded in the light of quarries from which everyone was free to take materials for use on building construction of every sort and description.

In this manner, among other notable instances, a whole village at Prambanan was ringed round with a stone wall built of blocks of stone carried away from the adjacent ruins of temples. Not only the Javanese, but Europeans, have plundered these ruins and materially assisted in their disappearance; even the Dutch Government has not been guiltless in this matter. Such temples as still remain standing above ground have been despoiled almost entirely of their statues and other ornamentation, which have been dragged away by thoughtless individuals to adorn their private houses or gardens. The origin of the majority of these looted statues is no longer known. When one reads the glowing description left to us by travellers in Java prior to the great earthquake in 1867, even when one remembers what Yzerman beheld on the Prambanan Plains in 1887, and sees these ruins as they stand now, it is absolutely impossible to avoid the sad conclusion that the modern development and the present flourishing condition of Java, even within the past half century have been fatal to the valuable relics of the art of ancient Java. One can but express the hope that, now the general public is more and more perceiving the great value of these historic monuments, the days of ruthless vandalism are doomed; but, alas! this belated realisation cannot replace that which has been lost irretrievably to the present and future generations. And so it is that one is forced to trust largely to imagination to fill in the gaps of the architectural designs employed by the Hindu architects of these temples.

South Facade of Kalasan.

View of Sari showing exterior ornamentation and Windows of Upper Chamber.

The first ruin seen on the road out from Djokjakarta is the most westerly situated of them all, that of *Tjandi* (temple) Kalasan. This ruin dates back to the earliest period of Hindu architecture, although it is not neces-

sarily the oldest temple in Central Java. There being no trace of other buildings which were erected possibly at an earlier date, it is impossible to arrive at any conclusion as to how and from what beginnings Hindu architecture developed itself in Java. In *Tjandi* Kalasan, however, their art had pretty well reached its full development. This ruined temple is considered to be among the most beautiful buildings that the Hindu craftsmen wrought in Java. It is generally believed that it was built a little prior to the Borobudur Temple—perhaps a quarter of a century earlier; and this, according to modern historical knowledge, would date it about the end of the eighth century.

Tjandi Kalasan is designed in the form of a Greek cross with projecting angles; and it contains one large central chamber and four smaller rooms, of which only the eastern one is joined to the main temple-chamber. No statues are left standing in any of these rooms. The temple itself stands upon a sub-base, which supports the foot of the temple proper after the fashion of a terrace. Little is now to be seen of this sub-base; part of it is broken away, and part is hidden and lost to view under the ground, as, in the course of the centuries since it was built, the bottom has been raised. This sub-base had the same twenty-angled form as the actual foot of the temple. The unoccupied outer edge of the sub-base made it possible for people to walk round the temple, and it measured about fifteen feet in width and must have had a parapet in its original design. Four flights of steps, one on each face of the building, led up to this encircling free space. The temple had four doorways, to each of which a stairway led; and each doorway gave admittance to a side-chamber.

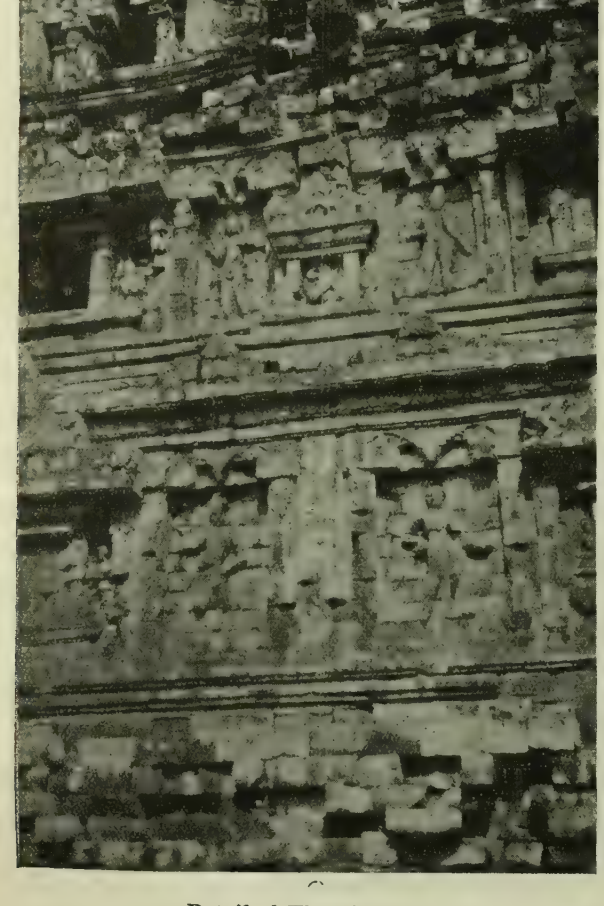
On the south façade, the ornamentations are still in existence; but most of the others have suffered severely through various causes.

Part of Exterior Wall of Tjandi Sari, showing rich Ornamentation and Win

On both sides of the richly decorated entrance on the south side are two small niches wherein a Bodhisattwa figure is excellently chiselled in relief. In the large niches of the side surfaces there stood originally other Bodhisattwa statues, for their pedestals still can be seen. An attempt is being made to restore this and other temples in the neighbourhood, and many of the fallen slabs of masonry and carved stone figures are being collected and repaired with a view to replacement on the monument; but it looks a pretty hopeless task.

Upon the cube of the temple, which carries a richly ornamented frieze and a cornice with handsome antefixtures, stands the roof which is crowned with a dagob of which only the socle is now in existence. The roof formerly had three stories, separated from the body of the temple and from one another by a profiled base, and each with its own cornice. Taking a horizontal section, the lowest story also follows the twenty-angled form of the building and is decorated with niches wherein once sat Dhyani-Buddhas upon lotus-leaf cushions. There are now only three of these statues in existence. In the second story, the roof takes an eight-angled form, each side containing a niche with a Dhyani-Buddha, and on either side of the niche is a panel whereon was carved a standing figure, —probably a Bodhisattwa. The top story again had eight niches, in which also were seated Dhyani-Buddhas. Only one of these figures, however, remains in place, and the others have all disappeared. All three of these stories were crowned with garlands of dagobs.

A very short walking distance from *Tjandi* Kalasan is to be found the ruins of *Tjandi* Sari. Actually, it is very doubtful if this was ever a temple or intended as such; it is much more probable that it served, in part at any rate, as a dwelling for the priests of the *Tjandi* Kalasan. It is a one-story building, once comprising six chambers, of which there were three in the lower space and three in the upper. The floor of the upper rooms has entire appeared. The entrance is in the façade, and gives access to the centre lower chambers. The latter is connecte the side-chambers, each of which ha windows. The entrance was reached stone stairway, now entirely disapp which led up from a terrace. There wa also an encircling parapet, as at Ka which apparently had a parapet in its o design. No exploration of this terrace h taken place.



The three lower chambers all exhibit on the back wall of former altars, whic built up against them but are now away. There are also niches which probably served to hold lamps. By a way, which has long since disappeare of the former character of which there a indications, one came to the upper cha It seems most improbable that these chambers could have been intended, or for any other purposes but living-rooms priests.

The eastern façade had a vestibule b to it, which has now entirely disapp The doorway between this vestibule a central chamber is now in the entranc the casual eye, the building appears t had a second story; but that is really o parapet wall, decorated with niches, crowns the façade of the first story. this wall rose the roof, which was ornar with dagobs; while the niches in the p were similarly adorned.

Of all the pitiful ruins of Hindu ar ture on the Prambanan Plains, *Tjandi* easily one of the best preserved; and evident, even to-day, that in early times very richly ornamented on its exterio special, one finds crowned window openi the façade, some of them being sham with panels on either side containing figures in relief.

It is generally thought that this b served as a monastery for *Tjandi* Kalasa there is a great deal to be said in fav this hypothesis. *Tjandi* Sari very ob was not intended as a real temple, such understand by the term, but has man cations that it was more used as a dw However, it has never been establish finitely that there were no other mor buildings nearer to Kalasan. In any *Tjandi* Sari was so small that it coul have accommodated a few monks. I we presume that the lower space was a tuary, it is still highly probable that o guardians lived above it in the chamber.

But if these two ruined temples ar deplorable state, those still further Prambanan are even worse.

TEMPORARY TIMBER CONSTRUCTION, INCLUDING SHORING—I

By G. A. GARDNER, M.I.Struct.E., Assoc.I.E.E., &c.

timber construction may perhaps be re-
as temporary in that its life under general
s limited, but the structures contemplated
title of this series of articles are those
rily constructed as a provisional measure
nection with work of a more permanent
ter. The permanence of wood itself under
able conditions can be very great, and two
e witnesses to this lie on the writer's table,
, a fragment of oak from a fourteenth-
y structure and a fragment from one
piles which supported and protected
rs of Old London Bridge, dating back to
irteenth century. These are, however,
ratively young; and examples of sound
n piling have been found over a thousand
old and some deeply-buried pieces, esti-
to be of a very much greater age.

types of temporary timber construction
rily associated with building works are:
nd Raking Shores; Trestles and Towers
umerous purposes; Crane Gantries;
s and Gangways; Temporary Ends and
Enclosures; Formwork for mass and rein-
concrete, &c. These various construc-
may range from simple assemblages of
s with nailed or dogged joints to carefully-
ed examples of carpentry of considerable
ude; and the whole group may be con-
to take a place intermediate between
y pole scaffolding on the one hand and
ermanent or finished timber structures on
ner.

skill of the scaffolder must be acknow-
in passing, especially when it is remem-
that he practises his craft without, as a
much as a conscious smattering of the
tary laws of structural mechanics. His
res have been tested by usage, but when
ft-times slender factor of safety is unex-
y encroached upon, collapse and regret-
oss of life have occurred. Has not the
rived when every master labourer should

and something of the theory underlying
ft he practises?

upper dividing line between temporary
manent timber structures is not a hard-
t one, and the more elaborate types of
ary construction may embody many of
nements of more permanent work. The
ve switchback structures at the late
y Exhibition were examples of more
ed temporary work; and two views of
these erections, in which the design was supervised by the writer, are given in Figures 1 and 2. More permanent structures are exemplified in the large Water-Cooling Towers erected in connection with steam-electric generating plants; in long-span "Belfast" roof trusses, &c.; but the most noteworthy examples of bold timber construction are to be found in the huge Howe bridge trusses (William Howe, 1840) still employed on the American railroads. Some of these have clear spans of 200 ft. and are 45 ft. in depth with bottom chords, composed, for example, of four 10 in. by 20 in. sections of Oregon Pine.

The nature of the joints and connections in temporary timber structures, *i.e.*, whether nailed or bolted, is generally dependent upon the character of the work, both as regards strength and stability and the time for which the erection is required to serve; but whilst a considerable degree of arbitrary choice may be allowed, the real criteria are: structural sufficiency, and economy in materials and fabrication. Tables will be given for the strength of nailed and bolted connections in a later article. To cite a typical instance governing this question of joints and connections, a tall temporary timber trestle-way may be briefly considered. Here the lateral bracing forming the trestles will generally require to be bolted through the uprights in order safely to resist the overturning force of the wind acting upon the structure itself and any load being transported over the gangway, but the longitudinal sway bracing between the trestles may in many cases develop a sufficient resistance through nailed joints only. In some instances, however, although nailed longitudinal members might be adequate as sway bracing, the slenderness of the uprights would perhaps necessitate the provision of horizontal rails *bolted* to the uprights and stayed at intervals by bolted bracings forming stiffening towers between pairs of trestles. These matters may all be decided by the structural specialist with a sufficient degree of certainty for practical purposes.

The consideration of joints and connections opens up the general question of the basis of design for temporary timber structures; and as regards the *strength* of timber framework with the simple type of lapped joint extensively used in temporary work, it is often the case that connections cannot be made to have a potential value equal to that of the members themselves. This will readily be perceived in the case of braces acting in tension, where the ultimate bearing resistance of the bolted connection to the contiguous timbers may be very much less than the ultimate tensile strength of the brace—this is in the very nature of things, although the trouble may be lessened by careful design, whilst, conversely, it may be—and often is—aggravated. The writer noticed quite recently a temporary unloading bunk in which some 5 in. by 11 in. braces were attached to the uprights by a few 6 in. nails; although in that case it was an incompatibility worse in appearance than in effect, since of course a much smaller size would have sufficed for the braces. Where a timber framing can be constructed with steel rods to take the tensile forces, the joint sufficiency is generally more easily provided, since the timber compression members can usually be arranged to take a direct endwise bearing against other parts of the framing, as, for example, in the combination roof trusses of iron and wood built about the end of the last century; but in purely temporary construction the use of tie rods does not appear to be justified as a rule, except in work of considerable magnitude where the forces to be met are heavy.

Any temporary timber erection which is called upon to function structurally and is outside the category of a mere fence or hoarding should at some time or other before being sanctioned for service come under the approval of one sufficiently versed in structural mechanics to judge or ascertain its sufficiency; and it may perhaps be said that in all but trivial cases safety with economy would be best ensured if the structure were designed beforehand rather than merely erected in accordance with the dictates of practical judgment.

This does not, as a rule, imply a tedious process of calculation, and in many cases a simple computation of loads and forces, and reference to tables of safe carrying capacities, is all that is necessary. It may be pardonable in this connection tersely to re-state the case for theoretical investigation which has been ably put by several writers in the past:—Theory does not consist in the mere employment of algebraical symbols but in the exercise of *reason*, and theory is continually necessary in that problems constantly arise beyond the stage where precedent and experience will carry us. Everybody, in fact, employs theory—*i.e.*,

Fig. 2.—Detail of Switchback Railway Structure at the Wembley Exhibition.

reasoning—of some kind, and the desideratum is that their theory be sensibly complete, bold, and practical rather than crude and indecisive. It is not too much to say that the lives of building operatives are sometimes sacrificed to the theory that "Theory" is pedantic and unnecessary in connection with temporary timber erections.

In the design of timber structures the first necessity is to compute the loads and forces with reasonable accuracy, and in the case of dead shoring, for example, to consider carefully the contingency of the wedging operations (if any) tending to pick up more load than the minimum possible under purely static conditions. There is a tendency to shelve this elementary task of computing the weights in detail, and to relegate the matter to the "say" category—say, so many tons: a process which is only justifiable when an emergency decision has to be made on the spot in connection with the prevention of an imminent collapse. In the case of towers and trestles the force of the wind is often the chief load to consider, and in instances where Building Code wind pressures are enforced a somewhat extravagant use of material usually results. It is regrettable that in London and other industrial centres no systematic records have been taken of wind-pressures, and that very little is known as to the actual intensities common in "built-up" situations. In the past, building code legislators in a desire to make their regulations fool-proof have erred on the heavy side. In the writer's opinion a reasonable basis to design on, however, is to consider the effect of the wind as equivalent to a horizontal pressure of 25 lb. per sq. ft. at a height of 100 ft. from the ground level, with a reduction varying according to some plausible rule down to a value of

5 lbs. per sq. ft. at the ground. In seeking to plot a graph showing such values a parabolic curve naturally suggests itself and gives rise to the simple formula $p = (2\sqrt{h}) + 5$, where p is the pressure in lbs. per sq. ft. and h the number of feet in height from the ground. A copy of the graph is given in Fig. 3.

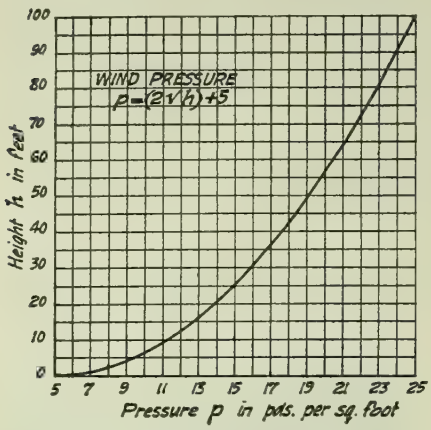

FIG. 3.—WIND PRESSURE GRAPH

For heights considerably above 100 ft. special considerations may be necessary; and for sloping surfaces the reduction coefficients given in Duchemin's formula (*see* structural text-books and steel contractor's hand-books) are considered satisfactory. If the temporary structures contemplated in these articles are designed for the above pressures with the customary factors of safety, a sufficient margin of strength and stability will be embodied to meet the contingency of squalls, and in situations where there is a definite sheltering effect from surrounding structures lower pressures may be chosen—*e.g.*, $p = (1{\cdot}5\sqrt{h}) + 3$. In the case of open framework the wind influence on the leeward members must be allowed for, and as a general rule not less than $\frac{3}{4}$ p. should be taken over their projected area, with the full value of p if they are situated remote from the windward surfaces. For members of circular section only 0.6 of the projected area need be reckoned. Remember, it is considered that the wind may blow at any horizontal angle to the structure; and the writer has come across some important errors as a result of a designer thoughtlessly reckoning on the pressure being only normal to the drawing paper!

In leaving these brief remarks on wind-pressure, let it be borne in mind that there are numerous scattered references to the subject in technical literature (dealing with negative pressure, *i.e.*, suction, the force of gusts, &c.), which will well repay a careful perusal and comparison; and that, moreover, the values suggested above do not purport to lay down a law for the force of the wind at varying heights, but merely give a satisfactory equivalent designing basis for temporary timber structures under the general run of conditions met with in this country.

The question of "live" loads and the effects of impact must be dealt with, and here again a considerable amount of speculation is inevitable unless the somewhat crude and extravagant practice of always doubling the dead load is to be followed. The effect of impact due to the bump of wheels over rail joints, the clumsy dumping of a load from a crane, the vibration due to machinery, and such like, may be considered as distinct from the effect of an increase in stress due to the time rate of application of a load applied without impact. The rapid running of a motor lorry over a smooth asphalte road finish to a bridge deck will, in itself, cause elastic vibrations in the supporting structure, with a sympathetic increase in stress, quite apart from the impact or blow which might result from a wheel passing over an obstacle, such as a large stone. In practice, the total estimated effect of any kinetic or "live" loading is generally considered under the heading "impact," and fairly reliable estimates have been established in connection with the design of railroad and highway bridges, but in the miscellaneous cases which have to be considered in temporary timberwork it is difficult to lay down hard-and fast rules—the force of a blow on a buffer frame at the end of an elevated truck-way, and the racking effect on a tower due to the unbalanced revolutions of sundry belt pullies, causing alternating stresses, are cases met with. It is more accurate to deal with the effects of kinetic loading by compensating stress reductions when stipulating the allowable design stresses to be used in a structure as a whole or in parts of it—for instance, the cross bearers of a temporary truck-way would be designed to a lower stress than the main beams or trusses—and it is even more accurate still to estimate and calculate the kinetic stress effects due to the combinations of dead and "live" loading, and to so design the structure that the materials will not be stressed beyond a fixed limit. These refinements are not, however, as a rule justified in temporary timber construction, even of considerable magnitude, but a structural specialist may have occasion to employ them when being called upon to make a pronouncement as to the probable sufficiency of a structure already built.

A few approximate values may be suggested as a guide:—

Type of Structure.	Part of Structure.	Equivalent Static Load as percentage of Actual Load.
Contractor's Railway-Gantry, or Loco. Crane Track.	Track Joists.	200 %
	Longitdl. Beams.	150 %
	Posts.	125 %
Platform for slowly moving Lorries.	Cross Joists.	150 %
	Longitdl. Beams.	125 %
Block and Tackle Hoist.	Beam.	175 %
Travelling Crane.	Track Beams.	133⅓ %

A later article will deal with questions affecting the design of component parts of structures, *i.e.*, posts, beams, braces, joints, &c., and the remaining item to be considered now is the location of the structure as governing the stress basis for design.

If the timber is to be erected in a wet situation where fibre saturation of the wood may obtain as a fairly constant condition, *e.g.*, in the case of jetties and water-cooling towers, lower unit stresses are sometimes stipulated as compared with cases where seasoned timber is to be employed in dry locations; and moreover, the increased weight of the saturated wood may be of sufficient importance to be reckoned with in some instances. Laboratory tests show a well-defined increase in strength as a result of the drying out of small clear green specimens, but in large structural timbers this would be offset by splits and checks caused during the drying, and only a low percentage increase can be reckoned on. Tables of Working Stresses and matters relevant thereto will be dealt with in the next article.

(To be continued.)

THE WEEK IN PARLIAMENT.

WESTMINSTER, WEDNESDA

The House reassembled, after the Ea Recess, on Tuesday, April 26.

The Architects' Bill.

The following members have been pointed to form the Select Committee to sider the Architects' (Registration) Bil Sir Clement Kinloch-Cooke, Mr. Gard Sir Alfred Hopkinson, Mr. Lindley, Murdoch Macdonald, Colonel Moore, Frederick Rice, Mr. Tasker, Mr. Vi Captain Wallace, and Dr. Watts. committee has power to send for pers documents, and records, and three is t the quorum.

The first meeting of the Committee, on Tuesday, was private. The Commi elected Sir C. Kinloch-Cooke as chairm and decided on their mode of procedure.

The Pottery Duty.

The House of Commons, by 242 vote 142, has passed the Budget resolu imposing a duty of 28s. per cwt. on impo transculent and vitrified pottery.

Rural Housing.

Mr. Hurd asked the Minister of Healt he would state how many rural dist councils had been appointed the authori to work the Housing (Rural Workers') out of the 220 councils which applied t so appointed; and on what grounds applications from those councils granted and refused, respectively?

Mr. Chamberlain said that the g majority of those applications were u consideration by the appropriate Co Councils with whom he had been consul as prescribed in the Act. Applications been rejected in 49 cases where the Co Council had made, or were making, a sch which would cover the whole of the adm trative county. Approval was being g in 22 cases where the County Council not themselves at present proposing to c out a scheme, and were of opinion that work might properly be entrusted to District Councils concerned.

Building Material Prices.

Mr. Chamberlain informed Mr. R. M son that he had not yet received the sp report of the inter-departmental comm upon prices of building materials as to reasons why, despite lower fuel costs, prices of bricks, glazed ware and other b ing materials were still higher than be the coal stoppage.

Architectural Assistants.

Mr. E. Brown asked the Secretary Air whether consideration was being g to regrading certain posts of architect and engineering assistants and draughts in his department; whether he was a that the establishment branch of the Ministry had refused to consult with organised body representative of the inter of the ex-Service staff involved; and whe he could now give an assurance that in such regrading consultation would be with this body before any final decision come to so as to ensure ex-Service m interests.

Sir S. Hoare said that the answer to first part of the question was in the affi tive. The adoption of the title "draug man" or "architectural assistant" wa professional and not an ex-Service quest and any negotiations were appropria conducted with the professional associa concerned through the medium of the Whitley Council. The Air Ministry was fully aware of the wishes of the staff affec which had been put forward not only through Whitley channels but also in a special memorial.

THE LONDON SOCIETY.

MODERN STREET ARCHITECTURE.

Mr. Arthur Keen, V.-P. R.I.B.A., took e chair at a meeting of the London ociety, held at the Royal Society of Arts, delphi, on Friday week last, when Pro-ssor A. E. Richardson, F.R.I.B.A., read a per on this subject.

The lecturer said that towards the end the nineteenth century, people began to alarmed at the chaotic appearance of the reets. By 1870 there had been spasmodic tempts to depart from the Gothic revival, ch as the efforts of Eden Nesfield, Nor-an Shaw, and others. There were also tempts to transplant the Parisian style, proaches to the American manner, and esh advances towards the historical otives of Europe. Steelwork had become specialised science; on the other hand, inforced concrete was looked upon with prehension. This was, indeed, a period wavering. In commercial quarters there is a growing distrust of the quasi-mestic character, which, for fifty years, id invaded offices and stores. By the year 10 the French influence of 1900 had pene-ated every architect's office in London, id about this time English architects be-n to turn their affections towards merica. When the new Selfridge building as completed, people lost their balance. ere, at long last, was a style suited to mmerce. The delay in completing ingsway and Aldwych allowed London chitects to show what they could do on milar lines. A new scale was introduced. ie issue, still obscure, had been further mplicated by Norman Shaw's building Regent Street. It was seen that by mparison with American examplars, the w English Classic was provincial in aracter. Then followed many abortive tempts to produce magnificence at the pense of uniformity. Apart from certain ildings, both Kingsway and Regent Street ight be named streets of good intentions. ut it could at least be extenuated that English architects had failed as a body produce a high standard for civic archi-cture, they had to their credit the revival a domestic expression, which was un-ualled in the world. The main argument his paper, said the lecturer, was to prove at architecture at all periods of history id taken its impulse from some dominant ctor of social life. In the past it ex-ressed religion, autocracy, and private terprise. The nineteenth century was e period of compromise between the old nservative traditions and the rising tide industry. The present was the great ge of business, all else was of secondary nportance. Architects and those who took t interest in building did not anticipate at commercial buildings would ultimately ve character to the whole of architectural terprise. Heaven forfend! But it was vious that if the main impulse was to ntinue to be of a commercial nature, ere was the resistance from whence the ief architectural expression for towns ould have to be derived.

London could be divided into districts, ther commercial or residential. The sub-visions included banks, offices, warehouses, ores, shops, places of amusement, railway ations, flats and streets of small houses. here were the main shopping centres and ie main business centres, namely, the City id the West End. All the other parishes itside the City and West End boundaries flected the inner dispositions in a lesser ay. Latterly London proper had deve-ped inner movements which tended to dis-ibute the old activities further afield.

The City of London, no bigger than it as in the days of Queen Elizabeth, was ediæval in formation; it had its narrow reets, courts and alleys, it clung to its heapside and its river thoroughfare, hames Street. The rebuilding after the Great Fire settled the divisioning of the narrow sites, many of which still repeated the ancient spacing. But the inner move-ment of London, already referred to as being of recent occurrence, had had the effect of spoiling the old values and demar-cations. The result was that London to-day particularly in its street architecture, pre-sented the appearance of a hobbledehoy.

From 1840 to 1890 the lack of an ordered plan for the Metropolis was not criticised. In spite of the increase of population Victorian London of the late period went on grading and segregating its people. There was a de-cided liking among the middle classes for emancipation from the closed, packed streets, and from this there resulted the taste for living in the rural districts near London which could be reached daily from town.

All this fondness for domesticity was bound to affect commercial architecture. Combined with lack of vision for anything approaching the Metropolitan idea, there remained the craze for congregating in crowds and the alluring attractions of town life which for a century and a half had been attracting a great proportion of the rural population.

The frenzied seeking for a modern expres-sion for commercial architecture was as bad as the exploitation of historical mannerisms. Even the development of ferro-concrete or the theory of a more logical manifestation of building facts would do little to help im-prove the face of London. There might well result, if the root cause was ignored, a worse depression than was the case to-day. The truth lay deeper, it was bound up with the replanning of London on grand lines. The proposed new bridges across the Thames opened up the prospect of new main thorough-fares, north and south, of a scale to improve the Metropolis for all time. At present London was an invertebrate mass; it needed a new series of wide thoroughfares, while im-proving and retaining the old. To be brief, the need of London was a new structural formation. If this were only partially realised, then would ensue enlightenment re-garding the factories, which would be gradu-ally regrouped between Barking and Tilbury, in connection with the vast Port of London. In relation to that new factory area dormi-tory villages would be established for the workers on the uplands of Essex. The City would be gradually freed from warehouses and given over entirely to offices. All wheeled traffic within half a mile of the Royal Exchange would be prohibited, the streets near unto the heart of the City being served by moving ways at the centre roofed by canopies. The Victorian suburbs would be gradually rebuilt on ordered lines. There would be one or two new main inner avenues completely encircling the City, the West End, and on the Surrey and Kent side, Ken-nington and Greenwich. Attempts would be made to zone the shopping centres and every encouragement given to group similar inter-ests. The existing terminal stations could be moved to points five miles from Charing Cross and linked the one with the other by a ceinture railway. Perhaps in a hundred years coal would be converted into electricity and power at the pit head. The main theory seemed to point to the elimination of un-necessary traffic within London, not the en-couragement of more. Give London the new main thoroughfares she so urgently requires and commercial architecture must improve in direct ratio. The tendencies of commercial architecture at the moment were towards expressing the character of the various pri-vate enterprises in terms of direct statement. Because of the fettering of tradition, the obsolescent building clauses of the Act, the iniquitous rulings of the laws of ancient lights, and the lack of unity in street de-signs, nothing resulted except quarrelling with the older and more satisfactory values which were out of date. New buildings, such as Adelaide House, Bush House, Devon-shire House and some of the recent office buildings in the City, proved the limits to which the treatment of Portland stone at-tached to the steel skeletons could be taken. Those buildings had merit, but they were piecemeal contributions to ancient London. The effect of new main thoroughfares would be to link up the existing squares and open spaces and to reveal the majesty of the historic buildings, many of which could not be properly seen to-day. The new streets would provide scope for comprehensive de-sign. There would be room for imagina tive designs. For example, blocks of retail stores could be schemed with roofways and flying bridges connecting the blocks. There would be shops at three levels and batteries of lifts at intervals. The upper ways would call for extra policing, but they would all be closed at night. Had both sides of Regent-street been planned on these lines, a species of Uffizi Gallery would have re-sulted, giving London one of the finest open shopping arcades in the world. Such ideas would at first be confined to the great shopping centres. As the new streets were rebuilt the effect of uniformity would serve as a contrast to the ragged effect of the older streets, and even if the narrow sites had to be retained a general height line could be determined and strictly adhered to. The next issue was that of material. We were to-day, said the lecturer, confronted with two oppos-ing factors, steel skeleton construction and veneers of Portland stone or brick. No matter which sort of compromise was effected in design treatment, the two factors did not answer the requirements of commercial archi-tecture. Portland stone was a magnificent material for official buildings, for churches and monuments, but it was sadly out of place when awkwardly attached to steel as a species of plating.

Commercial architecture should be re-garded as the dominant expression of City life. Of its very nature, commercial work, within certain specific limits, did not depend on historical conventions for its expression. It was the one form of building which ad-mitted of a divergence from tradition and one which ultimately would react on the whole cycle of practice. The lecturer said that he was not among those who advocated the wholesale use of ferro concrete. He was aware of the possibilities of that system of construction and knew of its limitations. But the possibilities were not to be lightly put aside. First there was the stimulus which must accrue to design from its reasonable use—a new material inevitably affected the design of buildings—and secondly there was the sure knowledge that that material would gradually clear the architectural atmosphere from the fog of styles.

The next point was associated with the arrangement of facades. Building owners and architects were still slaves to the fetish of large shop windows. The aim should be to encourage customers to enter the buildings, not to congest the pavements and to collect crowds to stare at a confusing display of goods. In the case of small shops there was some excuse, but none where the large stores were concerned. The chaos in the streets to-day was the result of the high pressure of modern civilisation, the pursuit of false ideals and greed. To conclude, new streets were required; these would bring forth a newer system of comprehensive frontages and gradually some settlement would be arrived at regarding zoning of interests, construc-tion, materials and expression. The issue was bound up with the ideal adjustment of commercial interests. There was scope for many committees, and finally control of civic amenities must be vested in one official body advised by a panel of experts.

Professor Richardson then concluded his lecture with a provocative and highly enter-taining criticism of slides depicting examples of modern London and Continental architec-ture, the proceedings terminating with a vote of thanks to the lecturer, which was heartily accorded.

ARTICLED PUPILAGE OR COLLEGE TRAINING

DISCUSSION BY STRUCTURAL ENGINEERS.

The Institution of Structural Engineers varied from their ordinary programme last Thursday, when in place of a scientific or technical subject, they discussed the question of what was the best method of training for their profession. Mr. H. J. Deane (President) occupied the chair. There was a resolution before the meeting in the following terms:—"That the system of education of structural engineers by articled pupilage is contrary to the best interests of the student, and should be superseded by education in recognised engineering schools."

Professor J. Husband, M.Eng., M.Inst.C.E., affirmed this, and Mr. Ewart S. Andrews, B.Sc., A.M.Inst.C.E., led the opposition.

Professor Husband said the articled pupil and principal signed an agreement by which the principal was bound to instruct according to the best of his ability. The principal might be a local practitioner with a staff of one or two assistants, and in such a case the pupil would be in almost daily contact with his principal, or with a reasonably efficient assistant, and would probably be engaged in a considerable variety of work. But he might be articled with a large firm or municipality, and depend for any valid instruction upon the good will and knowledge of his immediate associates. In such a case the knowledge might be present, but the good will was frequently lacking, and the pupil was often relegated for long periods to monotonous and unimportant detail work. Between the two extremes were many gradations, but where the pupil received a reasonable amount of instruction such instruction would necessarily be of the kind most quickly translatable into commercial value. Hence he acquired a habit of routine, and was able to contribute usefully to the day's work; but was often ignorant of fundamental principles which, if not acquired in youth, would probably never be mastered in later years. A middle course was frequently adopted, by which the pupil was allowed a certain amount of time in which to attend classes; and if a suitable institution was available within reasonable distance, the principal was thus relieved of much responsibility; but part-time students did not work so well as whole-time students, and could not derive so much advantage from the courses. As to the material from which the average articled pupil was drawn, the premium was a consideration with the principal, and frequently caused the acceptance of a pupil of inferior capacity. Moreover, having paid a premium, the pupil considered himself a privileged person in such matters as holidays and amenity to discipline. He came from a fairly well-to-do class, was seldom proficient in the fundamental knowledge essential to a successful engineering career, and was not likely to obtain that knowledge in the office. If he had a natural aptitude he might become a neat draughtsman; and he might (but probably would not) attempt to make up leeway by attendance at evening classes. The average youth, if he was not dependent for his livelihood on his own unaided efforts, was more concerned with pleasure than with work; but if the pupil was conscientious and industrious he would acquire the rudiments of his profession as practiced in his particular office. Thus, if the principal was a mediocre general practitioner, the pupil would be a copy of a type tending rather to stagnation. The best interests of the pupil were the acquisition of a sound working knowledge of his profession, such as would enable him, without loss of time, to command a reasonable remuneration in return for his services as assistant, with the ultimate aim of reaching the status of principal. But if real progress was to be made, there must be added to this the vital necessity of keeping in touch with innovations, improved methods of construction, and the particular knowledge bearing on his line of work. These could best be acquired in an institution. The weak point of the engineering schools was that there was a great lack of co-ordination between their prescribed courses of engineering training, and in comparatively few schools was there any attempt to provide a really sound course of engineering training, from the point of view of the practical engineer. Almost all the schools urged the students too much in the direction of research. There was too much mathematics. The application of higher mathematics to structural problems was to-day carried to excess. Compared with the articled pupil the school-trained man would approach his problems with a greater grasp of their latent difficulties. He might not be so expert in taking out quantities or preparing an estimate, but these were matters which he would quickly assimilate. He would have an advantage in surveying and, unless spoiled by excessive mathematics, would prove the more valuable assistant.

Mr. Ewart S. Andrews said Professor Husband had pointed out that when a pupil started the principal entered into a legal undertaking to give the pupil a training in the knowledge and art of his profession. The college authorities gave no such undertaking. It was not necessarily true that the pupil who came to be articled was ignorant of fundamental principles, and any principal would prefer to start with a pupil who was a graduate of a university. The ideal was to have both methods of training, but that was not usually possible. The problem was, given a parent or guardian with, say, five hundred pounds to spend on the training of a boy who wanted to enter the engineering profession, should that boy be sent to a school or articled to a good practising engineer? It must not be assumed that if the boy went to a school it would be the best, nor if he was articled was it sure to be to a poor practitioner. As to the articled pupil coming from a well-to-do class, this applied also to the engineering graduate. Professor Husband had set out the real danger of the engineering school, the giving of too much mathematics: many students—most of those who had the capacity to be good engineers—lacked the capacity to understand mathematics well; and generally the brilliant mathematician did not make a first-class engineer. If he (the speaker) had to place a boy, and could only choose between one course or another, he was convinced by his experience since leaving college that he would article the pupil to an engineering practitioner. Professor Husband had said that very few graduates of engineering schools failed to obtain a salaried post immediately after leaving college. That had not been his (the speaker's) experience; it was true certain official posts were open to university graduates, but most men who had gone through engineering schools, and had not been able to afford to follow this up by a pupilage, had found themselves at a very grave disadvantage. The engineering school gave a training which developed the student's mind, and would be of immense value to him later on, but it did not prepare him to be a practising engineer. The students were never given any training in the actual practice of the bread and butter work of the engineer. There ought to be training alongside the practical work in the office, and it was the duty of the principal to see that the pupil obtained this.

In a discussion which followed there was a decided preference for Professor Husband's point of view rather than that of Mr. Andrews. The general feeling seemed to be that there should be first college training and afterwards articled pupilag One speaker who advocated pupilag thought this should be accompanied l evening classes. Another thought the should be a scheme of part-time day class which could be attended by articled pupil The chairman pointed out that a studen if engaged on practical work while stud ing theory, would get a more realistic gra of that theory; also that besides the tec nical side of engineering there were su questions to be understood as that of wh constituted a contract.

Mr. Andrews, in the course of a rep to the discussion, pointed out that the was not before the meeting any questi of college training plus articled pupilag The question was whether one of the methods was better than the other. Pr fessor Husband agreed that a young m at the end of his college course was n an engineer. As to articled pupilage pl evening classes, it would take six yea hard work at evening classes to learn much as in a two years' full-day course.

MOCK AUCTIONS

A Bill was recently introduced into Parli ment to prohibit the holding of mock au tions. We have not seen the Bill, b according to the statement made by its intr ducer when it was granted a first reading, imposes a penalty for wilful misdescription f the purposes of sale of the origin or the quali and substance of the goods, and if the vend is an auctioneer it renders him ineligible hold a licence for 12 months after convictio The introducer stated that there we "rigged" sales where country houses we filled with inferior articles which were adv tised as if they were the property of the la owner, and in one such case a pair of vas the real value of which was £3 10s. were so for £85. The words "origin of the goods appear to have been inserted to meet su cases, but it may be a question whether penalty can be imposed, not for a misdescri tion of the goods themselves, or an asserti as to their value, but simply on a statemer false though it may be, as to their ownersh The public must show some discrimination f itself in purchasing goods.

Under the criminal law, as it stands at pr sent, holders of mock auctions are liable conviction in certain ways. Thus the holde of auctions with sham bidders who pretend be real bidders for the purpose of selling goo at prices grossly above their worth are liab to be indicted for conspiracy (Reg. *v.* Lew 11 Cox 404), whilst compelling a pers under duress to pay for a lot which has, to t knowledge of the person making the dema not been bid for by the person placed und duress, may amount to larceny (Reg. *v.* M grath, L.R. 1 C.C.R. 205). The cases t Bill is aimed at might appear to come und "false pretences," but there appears to a difficulty in framing an indictment becau of the well-known principle that "indefin praise upon a matter of indefinite opinion ca not be made the ground of an indictment f false pretences" (Reg. *v.* Bryan, 26 L. (M.C.) 90).

The Bill, it was stated, was promoted the Incorporated Society of Auctioneers a Landed Property Agents after consultati with the Auctioneers' and Estate Agents' I stitute, and has general support, and certainly is time that the practices aimed should be brought within a clearly defined pr hibition directed to secure certain conviction such cases, for the uncertainty of being ab to prove a false pretence has no doubt pr vented prosecutions being undertaken private individuals, but great care will ha to be taken when the Bill is in Committee see that it is framed in such a manner as attain its object, and the advice of expe criminal lawyers should be obtained on th part of the measure which relates to the fa pretence. A penalty by itself also appea inadequate, and in gross cases imprisonme should be imposed.

THE LONDON BUILDING ACTS AND THEIR APPLICATION.—XVI

By H. V. MILNES EMERSON, A.R.I.B.A.

ESCAPE FROM FIRE—L.C.C REGULATIONS (*continued*).

General.

) Proper guard rails should be provided
ne routes of escape on roofs, etc., and
d skylights, lantern lights and ventilat-
owls on the roofs of projecting shops.
) Clear gangways should be kept up to
between all staircases, gangways and
on all floors.
) All escape doors should be made so as
pen in the direction of exit or to swing
ways, clear of steps, landings, passage-
, etc.
) All doors usable as means of escape
both sides should swing both ways and
ept free from all fastenings.
) All such doors must, if required to be
ided with fastenings during the time
ons are upon the premises, be fitted
ng such time with automatic bolts only.
In buildings other than residential
lings a portion of the upper panels of all
esisting doors usable as means of escape
ld be glazed with transparent fire-resist-
glazing, and it is suggested that a
on of the upper panels of all other
cipal exit doors should be glazed with
glass, the glass to be at such a height
ill enable persons approaching the doors
pposite directions to see each other.
) Windows on the floors above the
nd floor facing the public way, street,
oughfare, or open space should be made
pen easily at sill level to a sufficient
ht and width to allow a full-grown
on through in case of need.
) Windows and doors affording access
external escape staircases, balconies,
ges, etc., should be marked on the inside
rge letters, "Exit in case of fire."

ote.—Section 7 of the Act of 1905 requires
uate means of escape from every new
ding (excepting a dwelling house occu-
as such by not more than one family)
h such building is a high building (60
or more high), or where more than 20
ons are housed or employed. Plans, etc.,
to be furnished to the Council showing
proposed means of escape, and it will be
d that generally the Council will agree
ny reasonable scheme, and the L.C.C.
als will render any assistance possible
ormulating such scheme.

should be noted that in paragraph 3 of
ion 7 that the fire risk, etc., shall not
ncreased. The Council have power to
tion increased areas of floor space, etc.,
rided that the conditions relating to
ns of escape and number of persons
loyed, etc., are complied with, but should
e conditions not be carried out, then the
ncil can refuse to issue a certificate, as
the recent case of a large building in
ent-street.

s with new buildings, any existing build-
(excepting a dwelling house occupied as
by not more than one family) which is
e than 60 ft. high, or where more than
eople are housed or employed, must be
rided with alternate means of escape is
uired by the Council. In this case the
ncil serve a notice upon the owner or
upier stating their requirements, but any
onable alternative means submitted by
owner, etc., will generally be agreed to
he Council.

such notices the L.C.C. usually try to
ide for all possible contingencies, but it
ften possible, when discussed with the
ials, to modify or even omit some of the
irements.

some factories there is a tendency to
ruct some of the exits on the ground
with goods, etc. A guard rail on the
le some 4 feet or so from the doors, or
r means, should be provided to prevent
obstruction.

A building, the upper part of which was used as a factory and the lower stories let to tenants, it was held that the whole building was not a factory, and that the owner could not be compelled to erect a staircase through the lower stories if by doing so he committed a trespass. (Q.B. 1900, 82 L.T. 195.)

Where the owner of a factory had received notice from the Council to provide means of escape from fire, which, if carried out, would have involved an act of trespass on other premises, it was held that the notice served was not final and that the magistrate ought not to convict for refusal to comply. (K.B. 1901, 17 T.L.R. 504.)

The Council must specify the works required for the protection of each factory separately where there are two separate factories in the same building, not being a tenement factory belonging to the same owner. (Ch. 1902, 87 L.T. 578.)

Under Section 149 of the Factory and Workshop Act, 1901, the expression "tenement factory" means a factory where mechanical power is supplied to different parts of the same building occupied by different persons for the purpose of any manufacturing process or handicraft in such manner that those parts constitute in law separate factories, and for the provisions of this Act with respect to tenement factories all buildings situate within the same close or curtilage shall be treated as one building. In the foregoing decision, as the mechanical power was not supplied from the same source, the two factories did not constitute one "tenement factory."

Premises occupied by three different persons in different parts, of which two parts constituted in law separate factories, it was held that as the mechanical power was not supplied from a common source, but was produced and used in the respective factories, the premises containing the two factories could not constitute a "tenement factory" within this section. (K.B. 1904, 91 L.T. 344.)

In small buildings one staircase will prove sufficient provided means of escape to adjoining roofs, etc., are provided. Where external iron staircases are used they must have dead bearings and not be cantilevered from the walls. If the staircase is to be used as a means of escape only, the treads can be 10 in. wide and the risers 7½ in. high, but if the staircase is to be used for general purposes it should be made easy going, *i.e.*, 10 in. tread by 6 in. rise, etc. Exit doors must open outwards, and the full width required should be between the doors and not the frames.

It might happen that an external iron escape staircase would land into or adjacent to a public thoroughfare or place. As this would probably be a means of entry to the premises by unauthorised persons, the lower flight can be hinged and balanced so that persons descending would cause the lower flight to slowly descend and be automatically locked in position.

The softest of internal wood staircases in old buildings can be rendered fire-resisting by means of Lewis dovetail sheeting and cement or plaster. This sheeting being solid and not perforated affords the same protection to the wood staircase as the plain sheets do to the metal and wood fire-resisting doors.

Preservation of Ancient Bridges.

The Council of the Royal Institute of British Architects have made a grant of £100 to the Society for the Protection of Ancient Buildings to assist the Society in their efforts to obtain the necessary particulars of old bridges which are worthy of preservation.

BOOK REVIEWS

English Decorative Plasterwork of the Renaissance. By M. JOURDAIN. (B. T. Batsford, Ltd.) Medium quarto, cloth. £1 10s. net.

The man painting the house-front of a past P.R.A.'s house greeted the great man as a brother of the brush; it is all a matter of degree, and so with plasterwork. To be a plasterer sounds uninspiring enough—you can ascertain his standard wage from week to week quite easily—but there are plasterers and plasterers to-day even as there were in the heyday of the Renaissance.

As a mere picture-book of beautiful things Miss Jourdain's volume on the plasterwork of the Renaissance would appeal to a wide circle of readers, but it will appeal more directly to architectural students and practitioners as a fine exposition of all that is best in the decorative plasterwork for which England has been so justly noted from Tudor to Georgian days. Bearing in mind Miss Jourdain's two great works on decoration and furniture work in England of the early Renaissance and the late eighteenth century, we naturally expect something of outstanding quality in this new venture; and we are not disappointed. Miss Jourdain is a diligent worker, an enthusiast in any subject she undertakes, and a facile writer.

If the "plastique art—the graceful fretting of roofs" was introduced into England by Italian craftsmen in the reign of Henry VIII and largely carried on by imported craftsmen, we can well believe that the craft secrets were soon bequeathed to native workers. Such names as Astari, Bagutti, Enzer and Franchini appear in records of the later Renaissance of the eighteenth century, and they were working side by side with the Jacksons, Sherwoods, Groves, and Mansfields of native stock. The few names recorded of the early Renaissance are generally English and the artistry of the plasterer developed mainly on English lines, just as in the case of the furniture and other adornments of the home. Take, for instance, figures 48 and 49, details from the Oak Room, and Long Gallery at Burton Agnes, Yorkshire (*c.* 1601–1610). These scrolling designs of flowering honeysuckle and wild rose hit the happy medium betwixt nature and convention—rather inclining to the former—and must surely have been designed by some sturdy Englishman with an innate knowledge of the countryside flowers and a special love for his national floral emblem; perhaps he was John Cobbe, who in 1601 was paid for "frettishing" the ceilings of Saint John's College, Cambridge, or Richard Dungan, the King's plasterer, who fretted the ceiling of James I's bedroom at Knole; that is as may be, but the Burton Agnes ceilings have practically disappeared, and Miss Jourdain has done us the service of unearthing C. J. Richardson's drawings and descriptions of them as they were in 1838. The modern decorator might with advantage adopt or adapt some of these comparatively simple early Stuart designs, even if he could not accomplish the tender fragilities at Melton Constable, Norfolk (Figs. 118 and 119), dated by the plasterer 1687. The very date is suggestive, but Miss Jourdain does not suggest that the models for the moulds in which these life-like birds, fruit and flowers were cast were carved by Grinling Gibbon. The specialist may discover evidences to the contrary, but they are as tender in treatment as the carved wooden swags which frame the doorways at Hampton Court Palace.

The moulds were the plasterer's stock-in-trade, and there is evidence, as shown by the authoress, that there were guilds of plasterers; in Devonshire we find the same or similar *motifs* at Barnstaple and North Molton, and again at Bradninch and Bradfield, indicating a local centre of the craft or work done by one family or guild. John Heath, who was employed by Henry VIII at Hampton Court, left to his second son Laurence "my moulds and moulded work that I served the King withal," showing that the moulds were a possession of value, indeed the craftsman's working capital.

Miss Jourdain takes us right through the art

of the plasterer or ornamental modeller from the fretted ceilings of Hampton Court (*c.* 1525–35)—simple geometrical schemes suggested by the Gothic joiners' flat timber ceilings with carved bosses—to the elaborate pictorial confections and sculptural hunting scenes that we find at Hardwick Hall, in 1597, to the school of Inigo Jones, the French influence of the early eighteenth century and the Palladians, and so on to the refinements in plaster treatment of walls and ceilings of Adam and the post-Palladian architects.

The book contains 115 plates from specially taken photographs in addition to a large number of measured and sectional drawings. These, together with text, in a format which does credit to the publishers, constitute a volume attractive to the connoisseur in arts and a valuable asset to the practitioner in these days of a revival in the art of plastic decoration.

The Art and Craft of Garden Making. By Thomas H. Mawson and E. Prentice Mawson. 5th edition. (B. T. Batsford, Ltd.) £3 15s. net.

The man or woman who, given the opportunity, has not planted a garden has lived in vain. Shakespeare's plays are redolent of English flowers and flower gardens, and some happy descendant of Faunus and Sterculus planted, in the last century or earlier, at Brockwell Park, S.E., a walled garden in which every flower mentioned by Shakespeare grows. The Mawson great folio on the "Art and Craft of Garden Making" ran to four editions before the war, and the fifth edition, rearranged and considerably enlarged, brings the whole matter up to date. There was a continuous flow of gardening literature from the Press in the decade ante 1914, and with a settled peace long may the reflow continue. The addition of the garden of the Peace Palace at The Hague to this new edition is a happy touch. Mr. Mawson is a gardening expert of twenty-five years standing, a fellow of the Linnean Society, and late lecturer on Landscape Design at the University of Liverpool. In conjunction with his son, Mr. E. Prentice Mawson, he is responsible for a considerable list of books and lectures on town-planning and allied subjects doubtless quite familiar to our readers. This book of gardens and gardening should prove a welcome addition to any library of general literature and an invaluable asset to the working library of any gardening enthusiast, amateur or professional. Architecture and landscape gardening are closely co-related and, as this book may claim to be the most complete compendium of garden design to date, it will make a special appeal to architects and builders. The 424 pages, properly indexed, include 514 plans, sketches and photographs, together with five fine full-page plates in colour. The twenty chapters commence with the historical side of the subject and finish with "Hardy perennials for Beds, Borders, &c."; and in between is all one could wish to know of site-treatment, lodges, gateways, gates, fences, drives, avenues, greenhouses, conservatories, herbaceous gardens, pergolas, water gardens, rock and bog gardens, lily ponds, and bathing pools, lawns and landscape effects, and indeed everything that goes to the making of a garden, small or great, from the garden of the cottage and semi-detached villa to the grounds of a mansion. The illustrations, both pictorial and diagrammatic, are both delightful and useful. The book as a whole is encyclopædic in matter if not in actual form, concise, practically informative, and very readable.

Acreage and Other Conversion Tables. By A. E. Gayer, M.Inst.M. & Cy.E., Principal of North London School of Surveying, Hampstead. Second Edition.

This is a card folding up into 9 in. by 3½ in. (pocket size), and when opened out contains in tabular form the necessary material for facilitating the conversion of square feet into acres, roods, and perches, links into feet, and feet into links, &c., and within its limits, where a large amount of computation has to be done, will save much time, with possibly a gain in accuracy.

ARCHITECTS' & BUILDERS' INQUIRY BUREA

We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters.

May we appeal to our correspondents to submit queries on paper of a size easily filed, and writt legibly as possible, or, better still, in typewriting?—

Squash Racquets Court.

[Replies to "Recreation," April 29.]

Sir,—The regulation size of squash courts is 31 ft. by 21 ft The front wall is about 18 ft. and the back wall 7 ft. The building is of brick with the inside faced to a smooth surface in cement. The entrance door and frame must be perfectly flush, including hinges and locks. The floor is formed with granolithic on a solid concrete foundation. A "tell-tale" board in hardwood is fixed on the front wall 1 ft. 9 in. above the floor. If "Recreation" will commmunicate through *The Builder* with the writer he will be pleased to give further particulars.

Public Schools.

Sir,—The net sizes internally must be 32 ft. long, 21 ft. wide and 15 ft. high to springing of roof. The roof should be arranged so that the daylight lighting is close to the springing; artificial light is by four or six specially shaped metal shades throwing the light away from the players but evenly illuminating the court. The back of the court should be solid 12 ft. high, and is usually arranged with a gallery above that height. In the back wall the only opening at floor level is a narrow door for access, being formed in teak painted white, and absolutely flush, including ironmongery, with the face of the plaster. It sometimes has a pocket for balls arranged in it. Some courts are without a door and arranged with a rope ladder from the gallery.

Ventilation is arranged in the gable ends above the springing of the roof and by large air bricks in the end play wall at floor level, as condensation on the surface of the walls is the great problem, and to avoid this the walls are plastered with a special non-sweating plaster, which finishes white and does not require painting; the back wall need only be plastered 7 ft. high. The floor is usually covered with 1¼ in. maple in long lengths and 4 in. widths on battens in concrete, and is painted white. The end play wall is fitted with a framed play board 1 ft. 7 in. high, the full width of the court at floor level, and 6 ft. from floor level. The 2 in. service line is painted on this wall. The lines on the floor are painted in red and consist of a 2 in. line across the court 14 ft. from the back of the court, and from this a central line to the back of the court; outside the cross line in the angles next the flank walls "service boxes" 5 ft. 3 in. square are formed by similar lines.

Gilbert H. Lovegrove, F.R.I.B.A.

Rain-Excluding Device.

[Reply to J. M., April 22.]

Sir,—I know of no patent device for the purpose required, but I believe that the application of metal striking slips as supplied for steel casements when hung direct to wood frames without containing metal frames, would be likely to answer the purpose very well, and I suggest your correspondent should get in touch with a good firm of metal window manufacturers. I have myself used a strip of curtain brass to exclude driving weather from a transome, and this has proved very satisfactory. We cut it the full width into the rebate on either side, and bedded it in red lead.

Architect.

Contract Question.

Sir,—A certain contract has been let after a tender had been accepted and the schedule of prices deposited. It has been discovered that the contractor has made a mistake of £100 in his addition, so that his schedule prices are actually higher than can be totalled to the contract figure. On what basis should the variations be adjusted? The contract stipulates that they will be measured and priced at the rate quoted in schedule of prices deposited within days of the signing of the contractor, the contractor appears to have some for claiming his figures as a basis. I very much in doubt upon the question should be glad of advice. Plea

London Building Acts.

Sir,—Would you be good enough to me whether there is a simple digest of L.B.A. for quick reference? I mean thing a little less exhaustive than Ban Fletcher's excellent work. You

[Perhaps Mr. Milnes Emerson's art now appearing in *The Builder* will b service to our correspondent.—Ed.]

Green Pantiles.

Sir,—Would it be safe to make us glazed pantiles of green colour from potteries that produce this material should the clay be of any particular vari A certain local firm has offered to although they have not previously such things, and as their price is cons ably lower than I have had elsewhere, wondering whether there is a "sa somewhere. Colou

Pine Sawdust Packing.

Sir,—We have to erect a range of ke which it is proposed should be constru of timber framing covered each side cement asbestos sheets, and the voids tween filled with pine sawdust ti rammed. We are given to understand if moisture reaches the sawdust it wil liable to ignite by spontaneous combus Pine sawdust is considered vermin p hence its choice for the purpose. information on this subject would be a ciated. Reade

Polish for Choir Stalls.

Sir,—I should be glad if any of readers could tell me the best and chea way to wax up some oak choir stalls f polish surface so as not to alter shade. They have simply been oiled in past and this oil keeps gradually wor to the surface.

A. J. V

Diameter of Drain Pipes.

[Reply to "Urgent," April 29.]

Sir,—I believe that the majority standard rules for sizes of drain pipes excessive, and it appears that the numbe 3½ in. pipes arranged in this building far more than actually required, so tha is not they that will govern the siz the drain, but the actual roof area. I recently constructed a block of build in which there is a roof area of a 5,700 sq. ft., and in which there ar W.C.s, 22 baths and wash basins and sinks. The outlet drain is 6 in. diam and proves quite adequate for all calls upon it. I have had it examined du storm weather and have never found running full bore. I consider that if correspondent provides a 6 in. drain each half of the building and a 9 in. their junction onwards, there is no fea to its capacity. Asse

Architects' Fees for Subsidy Houses

[Reply to "Subsifee," April 29.]

Sir,—The services described are ha covered by the R.I.B.A. scale, and hardly be assessed upon the cost of house. In such a case the fee charged w have to be assessed upon the amount labour involved, and upon the standing the architect, and in most cases one £10 10s. would probably be near the mar

THE BUILDING TRADE

THE LAW OF FIXTURES.—II.

r W. T. CRESWELL, Barrister-at-Law; L.R.I.B.A.; Associate (late Fellow) of the Surveyors' Institution; &c.

What are Fixtures?

ES are divisible into two classes; hose which when once implanted in l become "part of the soil" and irre- e, except with the consent of the d; and, secondly, those which a is entitled to sever during his tenancy, ich, until they are severed, form part freehold; and, if the tenant does not them, remain, after the end of his , fixtures for all time. (See Crossley s, Ltd. *v.* Lee, 1908, 1 K.B. 86).

etermining whether or not a chattel come a fixture, the intention of the affixing it to the soil is only material as it can be presumed from the manner ee of the annexation to the freehold. obson v. Gorringe, 1897, 1 Ch. 182; sby *v.* Shaw, 1888, 19 L.R., Ir. 307.) general rule that when chattels are d to the soil they become fixtures e set aside in some cases by showing ch items were not annexed for the *ent* improvement of the land, but for rpose of temporary enjoyment as chat- hus, chairs set up by the lessees of a and screwed to the floor, for better d enjoyment of the audience, are not s; but if they were placed there by sor they, of course, would be.

cles merely resting on the ground alone, they may have become in course of mbedded in the ground by their own , or through a weight being placed hem, or, again, articles merely resting k chambers (as, for instance, a weigh- achine) are all removable if they are tached or cemented in any way to a or stone foundation; and if it is s that the intention of the party them was not to make them part of alty. Thus blocks of stone, or blocks crete and the like, forming a drystone ry wall, and without any cement or to the joints, remain part of the nd irremovable; but similar blocks of or concrete stacked in the form of a n a stonemason's yard for convenient remain chattels. So, too, posts and ut up by a tenant remain chattels, as ood or iron hurdles moved from day , or from season to season, and not as a permanent fence. Also a barn on pattens or blocks of timber, but not o the soil, is removable as a chattel.

term "fixture" does not include such as windows, or other like things, when orm part of the structure itself. In Bos- Crucible Steel Co. (1925), 1 K.B., 119 the frontage of business premises d at the corner of two streets con- mainly of plate-glass windows, not to open, but fixed in steel beadings; he lessees had covenanted to keep the thereof, including all landlord's fix- in good repair. The lessor claimed he lessee damages for non-replacement tain of the windows which had been . It was held, on appeal, that the "landlord's fixtures" applies to chat- hich are brought by the landlord to emises and *affixed* to the structure, not form part thereof. In this case, indows formed part of the structure of ilding, and consequently were not re- le by the lessees, the defendants in tion.

The Intention.

we have just said, if the intention of ant when placing a chattel on the es is that it shall remain permanently premises, it is treated as being per- tly attached to the freehold and irre- le. It need not necessarily always re- in the same position. If suitable, it can be taken down and re-erected on the same premises in another position for convenience. But, in general, it may be stated that the decision of the court will always depend on the evidence; that is, on the special circumstances and the intention of the party who himself fixed the chattel in question on another's land.

Constructive and Indirect Annexation.

An article may be attached to the freehold by "indirect annexation." That is, it may become a fixture by being attached to something which, in its turn, is fastened to the freehold so as to form part of it. Thus, where a tenant had erected a verandah, the lower part of which was attached to posts fixed in the ground, it was held the tenant could not remove it.

In general essential accessories or adjuncts to fixtures, whether in themselves movable or not, are governed by the same rules as are those fixtures themselves; and if there is an article which in itself is removable, and yet forms an essential part of an article that is a fixture, it is also a fixture by what is termed constructive annexation, such, for instance, as a detachable part of a machine, the key of a fitted wardrobe, and a millstone (even if removed for repair) forming part of a machine which is a fixture. If a machine is kept in position by its own weight only, and not fixed in any way, except that it is attached to and driven by a fixed mechanism, of which it does not form an essential part, and if the removal of the machine itself would cause some slight damage to the building, it has been held that such a machine is not a fixture. But in Monti *v.* Barnes (1901), 1 K.B. 205, when a mortgagor of a freehold dwelling-house, after executing the mortgage, removed certain fixed grates from that house and substituted for them an equal number of dog grates in the fireplace openings, which merely rested by their own weight, it was held that the true inference was that the intention had been to substitute the dog grates for the fixed grates for the improvement of the property, and that they were therefore fixtures.

Degree of Attachment.

The two principles governing, as between heirs and executors, the degree of attachment were fully considered in Leigh *v.* Taylor (1902), A.C. 157, when it was stated (1) that if something has been made part of the house it must necessarily go to the heir, because the house goes to the heir; (2) that, on the other hand, when it is something which, although it may be attached in some manner or another to the walls of the house, yet, having regard to the nature of the thing itself and the purpose of its being placed there, as not intended to form part of the realty, but as only a means of enjoyment while the person fixing it is temporarily there, then it is removable and goes to the executor. In the case quoted the question was whether certain valuable tapestries introduced by a life tenant to a house for the purpose of ornament, and further affixed to the walls thereof for the better enjoyment of them as chattels, and which tapestries could be removed without

doing any structural injury, had nevertheless been so affixed to the walls as to become part of the structure or were still merely chattels passing on the death of the tenant for life to the executor. It was held that they were removable by the executor. But in *re* Whaley (1908), 1 Ch. 615, the last case was stated to have a distinct character. Here a testator had, in his lifetime, bought a house, in which the *former owner* had fitted and decorated the dining-room as a perfect specimen of Elizabethan furnishing, with tapestries fixed to the walls, being nailed upon wooden frames which were kept in their place by the mouldings of an oak dado and frieze above, fastened to the wall by screws. Also there was a picture, painted on wood, of Queen Elizabeth attributed to Zucchero similarly fixed and bought with the house. It was held that the picture and tapestries were fixtures, having been fixed as part of a general scheme of decoration, and not for their better enjoyment as individual chattels; and that they passed, under the devise of the house, to the devisee and not to others under a gift of chattels. Later, in *re* Lord Chesterfield's Estates (1911), 1 Ch. 237, this last ruling was followed; for here it was held that the executor of a deceased owner in fee has no right to remove from the inheritance more than that which, really and properly considered, was not fixed to it in a definite way. Here carvings were fixed to the walls of various rooms, by means of nails or pegs driven through them into stiles built into the walls, and it was held that they being fixed, in a definite way, to the inheritance so as to form part of the house, they remained part of the house and were fixtures. Generally tapestries, pictures in panels, frames filled with satin and attached to the walls, statues, figures, vases and stone garden seats placed and being essentially part of the property, or of the architectural design of the buildings or grounds, and fashioned in whatever manner, remain part of the premises, and are fixtures, but pier glasses and pictures, not in panels and not forming part of the building, are not fixtures. (See D'Eyncourt *v.* Gregory, 1866, L.R. 3 Eq. 382.)

In Pole-Carew *v.* Western Counties and General Manure Co. (1920), 2 Ch. 97 C.A., the company leased premises upon which, at their own expense, they erected ordinary buildings for their manure manufacture; and also a complete plant for making sulphuric acid on the "chamber process," consisting of pyrites burners, four reactive chambers, and two towers, known as a "Glover tower" and "Gay-Lussac tower." Three of the chambers were of great size. It was held that the chambers and the towers must, having regard to all the circumstances, be regarded as integral portions of one composite building permanently annexed to the freehold, and not as chattels or as tenants' fixtures.

A Belt of Parkland round Newcastle.

A comprenensive scheme for preserving an unbroken belt of parks, moor, and pathway round Newcastle is, we understand, shortly to be submitted to the city council. Under the scheme, which has been prepared by the Newcastle-upon-Tyne Society, the sylvan belt would be drawn in the form of a curve from Scotswood (Denton Dene) round the Town Moor to Heaton (Ouseburn Vale).

Big London Property Deal.

A sum of nearly £700,000 was the purchase price in a big London real estate deal involving several blocks of flats which has just been completed. A new company has been formed to take over the properties, which include Oakwood-court, Kensington; North-court, Westminster; 2, Weymouth-street, W.; St. Ermins, Westminster, the well-known block of buildings adjacent to St. James's Park, covering about an acre of ground, and Grafton House, Tottenham Court-road. The total rental of these properties amounts to over £106,000 per annum.

THE REPRESENTATIONS OF THE CENTRA VALUATION COMMITTEE

The Report containing the representations of the Central Valuation Committee constituted under section 57 of the Rating and Valuation Act, 1925, to formulate principles for the assistance or guidance of Rating Authorities, Assessment Committees and County Valuation Committees, is an important document requiring careful consideration. It commences with an introductory statement explaining the constitution and functions of the Committee and the existing system of valuation and the changes to be effected under the Act which lead up to the resolutions they have passed. It is an interesting sketch, but except for quoting the following figures we pass to the resolutions themselves.

There are at present Overseers for 14,000 separate parishes and Union Assessment Committees for 600 poor-law unions. In 1926 the gross value recorded in parochial valuation lists amounted in April to £377,619,000. In the years 1913-14 the sums raised by local authorities from local rates was £71,276,000, the Government grants amounting to £22,617,000. In the year 1924-25 the amount raised from the rates was £142,000,000 and the Government grants £82,300,000. These figures total £224,300,000, 64 per cent. being derived from the rates and 36 per cent. from the Government.

These figures give some idea of the growth of local expenditure, the amount from the rates having been doubled in the eleven years, whilst the Government grants have all but quadrupled, and we may well ask when is a halt to be called in local expenditure, for the above total exceeds the pre-war National Budget by more than 24 millions.

The Resolutions.

The first resolution recommended that in each administrative county the County Valuation Committee should call a conference of the Assessment Committees and (or) the Rating Authorities with a view to determining in which areas the preparation of the new valuation lists should be commenced so as to come in force on April 1, 1928, and which shall be deferred to April 1, 1929.

And it was recommended that in coming to a decision on this matter the authorities concerned should have regard to the work to be done with the staffs available, and particularly to (*a*) the fact that the new provisions in the Act with respect to the rating of machinery and the exemption from rates of three-quarters of the net annual value of agricultural buildings will take effect in any rating area from the date on which the first new valuation list for the area comes into force; and (*b*) to the desirability of securing, so far as may be practicable, that the valuation lists for all rating areas within a poor law union shall come into force on the same date in order that the union common charges may be charged throughout the union on a uniform basis. A note to this recommendation calls attention to the fact that the County Rate Basis will not be superseded by the new valuation lists until April 1, 1929 (see the Act, Schedule vii, para. (10)).

The second resolution is of much more importance to the general public. After calling attention to the definition of "gross value" in section 68 of the Act, the Committee express the following opinions, which we number as in the Report.

(4) That the definition means that all properties valued for rating purposes must be valued upon the basis of their value *at the time of assessment* and not upon the basis of their value at any earlier time.

(5) That while recognising that since 1914 there has been a general rise in the rental value of property, including that of a residential character, the Committee is of opinion (*a*) that it would not be possible to apply to any particular class of property any flat rate of percentage representing that increase throughout England and Wales; (*b*) that the several districts differ so much in char from each other as to make it futile to deavour to lay down a percentage of inc for any one district which it would be fa apply without modification to another dist and (*c*) that rental value is governed by su and demand.

Following upon the above opinions t follows the recommendation that the pr level or standard of rental value for each of property will best be ascertained after sideration of the returns which Ra Authorities are required to obtain under tion 40, subsection (1), of the Act from occupier, owner or lessee of *every* here ment, and that when for each district level or standard of rental value has bee ascertained the assessments (gross or net all hereditaments of a similar kind in the trict, which may fairly be estimated to h approximately the same annual value, sh be made to conform to the standard, whe the property be actually let on rental or h the occupation of the owner.

(6) That in fixing assessments, exce purchase prices paid, or excessive rentals tained, should be disregarded in so far as point to an annual rental above the an value of similar properties estimated in cordance with resolutions (3) and (4). (R lution 3 only referred the Rating Authoritie the definition of "gross value" containe the Act.)

(7) That as excessive rents should be regarded, so also in assessing properties rents of which have not been raised to extent of the general level prevailing, actual rent paid should be ignored and property assessed uniformly with other sim property.

(8) That it is recognised that some landl in various parts of the country have not creased the rents of their properties to amount which the Rating Authority might pect a tenant to be prepared to pay, but not in the discretion of the Rating Auth to assess such properties at an amount l than that at which neighbouring properti the same kind are assessed.

The only criticism which it appears t can be passed upon these recommenda (apart from any direction as to inspectio properties) does not affect the work of the mittee, but apply to the conditions preva in the country at the time this measure has made to come into operation. The whole of the recommendations is contained in graph (5) (*c*), "Rental value is governe supply and demand," and we ask ours how can supply and demand come operation when a large number of prope remain subject to Rent Restriction? laws of supply and demand as regards ce kinds of house property have been suspe ever since 1914, and the restriction has steadily extended until it culminated in by the inclusion of houses of the *standard or rateable value* not exceeding £105 in Metropolitan Police District and Cit London, and elsewhere £78. The supp those houses has therefore been limited the demand for similar houses has been s lated, and if, as the Committee suggest level or standard rental value has to be upon the returns made in respect of hereditament, where is the normal standa be found? Within the limits of Rent Re tion there has been no free market at all supply has been limited by the retentio protected tenants, so that the demand has forced up for houses of that character, a is difficult to see how in such circumst any normal rental values within those can be found. With a very large prop of the houses tied as to rent, the questi to what are "excessive prices" or "exc rents" cannot be based on supply and de —it must be more or less guesswork before such a measure as the Valuatio

as brought into force we cannot but think hat the Rent Restriction Acts should have een repealed for a considerable period or that easure deferred.

There is also the further point that the time s ill-chosen when a large proportion of the opulation is still unhoused, and when some 00,000 more houses are still required. Rental alue, as the Committee observe, should be overned by supply and demand, but surely hat should be normal supply and demand and ot a demand based on a lack of supply, conitions which make for excessive prices and entals.

Weekly and Monthly Tenancies.

As regards properties let on weekly and monthly tenancies which include rates it is ecommended that care shall be taken in conerting the tenancy into a hypothetical yearly enancy for the purpose of arriving at the gross value to be entered in the valuation list, o make an appropriate deduction in respect of hose rates (including any water rate, which is usual tenant's rate and is paid by the owner), and it is suggested it would be useful f the amount of the appropriate deduction were calculated for each 3d. of inclusive rent and were set out in a table or tables—regard, however, being had to the fact that the appropriate deduction will differ in different areas in so far as the amounts in the £ of the rates are different.

Short-Term Agreements and Leases.

In the case of properties held on agreements and leases for a comparatively short term, for which a gross value has to be entered in the valuation lists, it is suggested that (*a*) where the agreement was made or the lease granted not more than three years before the date of assessment, or, if made or granted before, could have been determined by notice given within that period; (*b*) no premium or other like consideration has been paid by the tenant; and (*c*) no improvements to the hereditament have been effected by the tenant, the following practice should *as a general rule* be followed in arriving at the gross value:—(i) Where the landlord undertakes or is liable for both internal and external repairs and insurance, the annual rent reserved under the agreement or lease should be taken as representing the gross value; (ii) where the tenant undertakes or is liable for internal repairs only, the annual rent reserved under the agreement or lease plus 5 per cent. of such rent should so be taken; (iii) where the tenant undertakes or is liable for both internal and external repairs, the annual rent reserved plus 10 per cent. shall so be taken.

In the case of all other agreements or leases for a comparatively short term the annual rent (if any) reserved under the lease should be reviewed in order to arrive at the gross value, and in such review regard should be had (*a*) to the date on which the agreement or lease was granted; (*b*) any premium which has been paid in a lump sum or which has to be paid from time to time or any other like consideration; (*c*) the extent to which the tenant undertakes or is liable for the maintenance of the hereditament; (*d*) any improvements to the hereditament effected by the tenant; (*e*) the annual rents paid for similar property in the neighbourhood; and (*f*) any other circumstances which may affect the gross value.

Freeholds and Long Leaseholds.

As regards freeholds and long leaseholds, the recommendations are (*a*) that where property is the freehold of the occupier or held by him on long lease, and where in either case the property might fairly be let upon a yearly tenancy, the rent which a yearly tenant might reasonably be expected to pay (if regard were had to the rents paid for similar properties actually let upon yearly tenancies) should be taken as representing the gross value; (*b*) that in dealing with properties of a kind that are rarely, if ever, let from year to year and to which the ordinary tests of rent paid, or comparable rents paid in the district, cannot be applied; (i) recourse may be had to interest on effective capital value as prima facie evidence of, or as a guide to answering the question as to, what rent a tenant may reasonably be expected to pay; but as so many considerations arise when deciding the percentage to be applied to the effective capital value it is not desirable to lay down any fixed percentage applicable throughout the country; (ii) in applying the views expressed in the foregoing paragraph due regard should be had to the age condition and present suitability of the hereditament for the purpose for which it is used, and the whole of the circumstances and conditions under which the owner has become the occupier should be taken into consideration.

Flats, etc., with Service.

In the case of flats, etc., let at rentals which include services, it is recommended that no standard rate of allowance for the cost of those services should be laid down, but the amount should be determined according to the merits and circumstances of each case.

The above is only a brief summary of some of the recommendations of the Committee, and the Report deals with many other subjects such as buildings let in self-contained flats, buildings let in lodgings, and apartments, farms, etc.

TIMBER SEASONING

The Movement of Moisture with Reference to Timber Seasoning. (H. M. Stationery Office.) Price 1s. 6d. net.

This is the first technical paper of the Forest Products Research Branch of the Department of Industrial and Scientific Research, by S. T. C. Stillwell, B.Sc., and is published under the Director of this branch, Mr. R. S. Pearson, C.I.E., F.L.S. The author's aim has been to investigate what actually occurs in timber during the process of evaporation of moisture, about which little is actually known, and as reliable data is likely materially to influence our views upon the commercial processes used in seasoning, the experiments should have a wide interest. The work undertaken is described in some thirty pages illustrated by diagrams, curves and formulæ. A series of experiments is described to show the rate of flow of moisture under defined conditions through plugs of timber of various kinds cut in various directions, from which it appears that the movement of moisture takes place in two ways: a movement in the wood substance itself, and a diffusion across the contained air spaces. The writer endeavours to establish a relation between flow of moisture and vapour pressure. The experiments are not concluded, and we look forward to a further publication which may put the results a little more within the grasp of the layman and the commercial man responsible for timber seasoning; a subject to-day of the greatest importance having regard to the prevalent use of immature soft woods.

Batsford's New Catalogue.

We have received a copy of Messrs. B. T. Batsford's comprehensive new catalogue of illustrated books on Architecture, Decorative and Fine Arts, Building, Social Life, Gardens, etc. The covers are decorated with reproductions of two charming water-colour drawings depicting street scenes in the eighteenth century, by Mr. C. H. B. Quennell. Copies of the catalogue may be obtained on application to 94, High Holborn, London.

"The Centre of the West."

We have received an attractive guide to Yeovil which has lately been issued by the Yeovil and District Chamber of Trade. Containing full information of the interesting country around this town, and illustrated by many delightful photographs, the guide has been written, we understand, by Mr. R. T. Warbis, of Messrs. Peders, Ltd., the makers of the Petter Industrial and Marine Oil Engine.

UNEMPLOYMENT INSURANCE.—II.

In our first notice of the Report of the Committee under the Chairmanship of Lord Blanesburgh, on Unemployment Insurance, we summarised the main recommendations put forward for a permanent Unemployment Insurance Scheme contained in the First Part of the Report, but the Second Part deals with what the Committee describe as subsidiary matters, but which they consider both of interest and importance. Having regard to the length of our first notice of this interesting Report, we cannot here touch upon more than a few of the questions dealt with in this part of the Report, but we set out the headings in full, as some of our readers may desire full information on some of these subjects and will see where they are dealt with in the Report. The headings are:—

I The scope of Unemployment Insurance in relation to—

(*a*) Contracting out (pars. 102-110).

(*b*) The excluded industries, *viz.*, agriculture, private domestic service, the permanent employment with the railway companies and of the local authorities (pars. 111–116).

(*c*) Certain minor matters (pars. 117–123).

II. The Waiting Period and the Continuity Rule (pars. 124–129).

III. The Trade Dispute disqualification (pars. 130–140).

IV. Dependants who should be recognised for the dependants' allowances (pars. 141–147).

V. The administration of State Benefit by Trade Unions and other Associations of workers (pars. 148–158).

VI. The effect of part-time work on benefit (pars. 159–161).

VII. Unemployment of disabled ex-Service Men (pars. 162–164).

VIII. Payment of surrender value to women contributors on marriage (pars. 165–166).

IX. Employer's statements as to the reasons for leaving work (pars. 167–169).

X. Use of Unemployment Fund for the creation of work (pars. 170–176).

XI. Co-ordination of Unemployment and Poor Law statistics (par. 177).

Contracting Out.

As regards contracting out, it is sufficient to say that the Committee did not favour it, and they found that the experience of the past few years had all but extinguished any desire for further contracting out, but to meet certain industries which considered they could frame a distribution of benefits more appropriate to the needs of their industry, it was suggested that the Minister in any case in which he was satisfied that the variation will in no way tend to the prejudice of the fund should have power to vary, within the scheme, the rules governing the distribution of benefit, in particular the rules as to the recognition of unemployment and partial unemployment in the interest of particular industries or other classes of insured persons.

The Excluded Industries.

As regards the excluded industries, the Committee recommended that agriculture and private domestic servants should continue to be excluded from the scheme. As regards the railway employees already excluded, the Committee indicated that on the principle that exclusion should only take place where the risk of unemployment is nil, they would have recommended their inclusion, but as they are excluded and the Trade Union Congress General Council did not urge their inclusion, the Committee acquiesced in the retention of the *status quo*, but considered this subject might require reconsideration in the future.

The Committee concurred in the exclusion of permanent employees of local authorities, and also found that the remaining exceptions and exemptions laid down in the Act of 1920 called for no change.

Minor Matters.

One or two matters of importance appear among the "Minor Matters" dealt with in

the Report. In the first place, it is suggested by the Committee that where the conditions of an industry, or section of an industry, are such that persons following it are normally not engaged in insurable work long enough to enable them to fulfil the condition of 30 contributions within two years, if such workers can show that in two successive years they have been unable for the above reasons to secure as much as a yearly average of 15 contributions, they should be entitled to claim exemption. But in making this recommendation in order to guard against any tendency on the part of employers to prefer exempted employees, the Report states that, if in accordance with the principles of the 1920 Act, the employers' contributions in such circumstances would not be refunded, this must continue as it is.

The Committee regarded with sympathy a proposal put forward by the Master Painters' Associations of England and Wales and of Scotland that contributions should not be payable in respect of apprentices except in the last year of their apprenticeship, but felt constrained to reject it.

The observations contained in the Report on the cases where insured contributors temporarily take uninsured work should be read with care. As regards those who temporaily go abroad, the Committee decided that nothing could be done, but as regards those undertaking uninsured work at home as a temporary measure, the Report points out that, if a person refuses uninsured work that is suitable for him, in any case he loses his unemployment benefit, but so long as that uninsured work is merely temporary he does not lose benefit if after it he becomes unemployed. The whole question turns on the question whether the change of employment is temporary or whether it had assumed a permanent nature. If a person, after a spell of uninsured work, can still show he has 30 stamps since the beginning of the previous two years, under the proposed scheme it will not be ineligible for benefit.

As regards outworkers, the Committee came to the conclusion they could not at present be included in the scheme.

This exhausts the "Minor Matters" referred to in the Report.

The Waiting Period.

As regards the waiting period and the continuity Rules, the Committee suggested no change. The "waiting period" is essential to the scheme and the continuity rules at present are (1) any three days of unemployment, whether consecutive or not, within a period of six consecutive days, are treated as a continuous period of unemployment, and (2) any two such continuous periods separated by a period of not more than six weeks are treated as one continuous period of unemployment. The Report points out that the rules are based on the principle that unemployed benefit should be paid to anyone who is unemployed at least half the time, but there are cases, where under the rules, it is possible for a person to be unemployed only two days each week, and yet qualify for the receipt of benefit for those two days. As the Committee decided that no change was necessary in the rules, it is unnecessary to consider the various suggestions laid before them, but it is interesting to note that it was estimated that a shortening of the waiting period to three days would involve additional annual expenditure of about £3,000,000, whilst to increase the six weeks "bridge" to three months would involve an increase of some £500,000 in the year.

The Trade Dispute Disqualification.

One of the most interesting sections of this Part of the Report is that which deals with the Trade Dispute Disqualification. To follow the recommendations of the Committee on this subject it is necessary to set out the two sections of the Act which at present represent the law. Section 8 subsection (1) of the Act of 1920, which substantially followed section 87 of the Act of 1911, provides "An insured contributor who has lost employment by reason of a stoppage of work which was due to a trade dispute at the factory, workshop or other premises at which he was employed shall be disqualified for receiving unemployed benefit so long as the stoppage of work continues, except in a case where he has, during the stoppage of work become *bona fide* employed elsewhere in the occupation which he usually follows or has become regularly engaged in some other occupation. Where separate branches of work which are commonly carried on as separate businesses in separate premises are in any case carried on in separate departments on the same premises, each of those departments shall for the purposes of this provision, be deemed to be a separate factory or workshop or separate premises as the case may be."

As the Report states, ever since 1911 there were complaints that the above provision excluded from benefit workers employed at an establishment where a trade dispute occurred in which they had no concern, as was the case in 1919, when a strike occurred of moulders, and the labourers connected with that employment were thrown out of work, although the labourers in no sense participated in that dispute and had no interest at all in its failure or success.

After a good deal of discussion and an attempt at an agreed clause between employers and workmen in 1924, the following amending section was passed (section 4 subsection (1) of the Unemployment Insurance (No. 2) Act, 1924):—"Subsection (1) of section 8 of the principal Act shall not apply in any case in which the insured contributor proves that he is not participating in or financing or directly interested in the trade dispute which caused the stoppage of work, and that he does not belong to a class or grade of workers members of which are participating in or financing or directly interested in the dispute, or that the stoppage is due to an employer acting in a manner so as to contravene the terms or provisions of any agreement existing between a group of employers where the stoppage takes place, or of a national agreement to either of which the employers and employees are contracting parties."

In passing, we must observe that a clause proposed by Sir John Simon appears to us far preferable to the above subsection; it was as follows: "Subsection (1) of section 8 of the principal Act shall not apply in any case in which the insured contributor can prove that neither he nor the trade union to which he belongs is participating in or financing or directly interested in the trade dispute which caused the stoppage," but the use of the term "trade union" was objected to and this clause was dropped.

The Committee recognised that this subsection can never take an entirely satisfactory form and they instanced one case showing this. The section does not disqualify a man actually unemployed at the date when a stoppage at his old works or in his industry takes place. The stoppage may have been organised by his own trade union and he may even have inspired it, and yet remain entitled to benefit, whilst his fellow trade unionists actually employed at the date of the stoppage, even those opposed to the stoppage, will lose all benefit. The Report suggests that such cases should in the interests of fairness be solved on some other principle than that now in force and suggests an examination of the question by the Minister in consultation with representatives of employers and employed, but the Committee did make one concrete suggestion on this part of the section which relates to "grades and classes," apparently inspired by the case of certain deputy and safety men in the recent coal stoppage. Men of these grades or classes were held disentitled to benefit everywhere, by reason of the fact that in some districts members of the grade or class were members of the Miners' Union affiliated to the Miners' Federation, and as such were participating in or financing the dispute. The suggestion of the Committee was that subsection (1) of section 4 of the Act of 1924 should be amended by limiting the reference to "grade and class" to the particular premises in which the insured contributor is employed, thus bringing the subsection in line with subsection (1) section 8 of the Act of 1920. Another important recommendation of the Committee relates to the final portion of subsection 1 of section 4 of the Act of 1924, which relates to cases where an employer has contravened a "group" or national agreement. The Committee recommend the repeal of this provision altogether. The reasoning offered in evidence against it may be summarised as follows: The merits of the dispute are involved, a question too remote or too difficult for unemployment insurance to concern itself with. It discourages long agreements, and tends to disturb industrial stability in consequence; Courts of Referees and the Umpire are not set up to interpret industrial agreements; it discriminates against the employer with no corresponding discrimination against the employees, for although when an employer breaks an agreement his workers can obtain benefit on the other hand, when the workers break an agreement, though they themselves are disqualified, the employer may be unable to fill their places, since the vacancies are "due to trade dispute" and may be refused, under the law, by other workers with impunity.

The Committee considered that collective bargaining and the authority and usefulness of associations both of employers and workers would be strengthened by its omission.

Dependents' Allowances.

The Committee recommended some minor changes in respect of the classes of dependents entitled to benefit, but in the main that the present classes should be retained. These are (1) a married man in respect of his wife who is living with him or who is wholly or mainly maintained by him; (2) an unmarried person or widower or widow in respect of a female person who (*a*) is residing with him or her for the purpose of having the care of his or her dependent children, and (*b*) is maintained by him or her; (3) to an unmarried man or widower in respect of a female person who is and has been living with him as his wife; (4) to a married woman in respect of an invalid husband who is prevented by physical or mental infirmity from supporting himself and is being maintained wholly or mainly by his wife; (5) to an unmarried person (not being a person entitled to dependent's benefit otherwise than in respect of dependent children) who has living with him and is wholly or mainly maintaining his widowed mother; (6) to a man or woman in respect of each dependent child who is wholly or mainly maintained at his or her cost.

The principal alteration recommended by the Committee is in relation to the third of the above classes, as it is suggested that in such unions as there described no benefit shall be given where there are no children. In class (5) it is also suggested that dependent mothers who are unmarried and widowed step-mothers should be included, provided they were really dependent on the claimant.

Also where both the claimant parents are dependent upon him and the father is permanently disabled and unable to work, it is recommended that a payment should be allowed in respect of the mother, and the Committee expressed a hope that where the claimant whose wife is incapacitated, *e.g.*, in a lunatic asylum, or who has deserted her husband, has a housekeeper to look after the children, the latter should be included. In all the above cases dependency for at least six months before the claim must be essential, and only one adult dependent is allowed in respect of any claimant. Before leaving this subject we may point out that as regards the rates of benefit which we set out in our last article the effect of the changes recommended is that an adult male claimant with a wife or other adult dependent has his benefit increased by 1s., while a single man without dependents has his benefit reduced by a like amount.

The Effect of Part-Time Work on Benefit.

We cannot in our space go through all the subjects the headings of which we give at the beginning of this article, but in conclusion we must allude to some observations contained in the Report on the effect of part-time work on benefit. Representations were made to the Committee that hardship occurs where unemployed persons who prefer work to idleness accept

employment offered to them only to find they have disqualified themselves for fit, and perhaps are worse off than if they refused work. The Report states this is in two ways: (1) Where a man obtains inuing part-time work; and (2) where the es of work he obtains are casual and short. position at present is as follows: If a man previously taken part-time work with inuity as well as his regular employment, e loses his regular work he can still draw fit and continue the part-time work pro- d his earnings must not exceed £1 a week, s. 4d. a day. If, however, before becoming nployed he only did his regular work, but s up part-time work on becoming unem- ed. then he will lose his benefit. The mittee recommend that a change shall be le in this matter to the effect that a man l not lose his benefit if the work which he s is really work which is commonly carried as a subsidiary occupation and does not g him in more than £1 a week or 3s. 4d. ay; that is to say, the necessity of his ing done the part-time work together with lar work before losing his regular work is ensed with. As regards the second case re the pieces of work a man obtains are ial and short the Committee could make recommendation, but they pointed out that cases must be few, as except in the sub- ary occupations, dealt with above, earnings ss than a days' benefit are not common. Ve have endeavoured to give some idea of main features of this very important ort, and we think from what we have said nust be apparent that it is full of interest requires careful study.

Building in Belfast.

he Belfast Co-operative Society is about to struct a large garage, which will house 100 ors when completed, and is to be modern and o-date in every respect. Other extensions contemplated to follow.

Census of England and Wales.

he General Report on the Census of gland and Wales, 1921, published by H.M. tionery Office, price 5s., completes the series official volumes which have been issued in pect of the 1921 Census. It provides a eral commentary upon the census statistics deals with the country as a whole in much same way as the Report issued with each nty volume dealt with the local figures, ugh on a necessarily larger scale. It also races those subjects of national interest ich could not be included in the county es The principal subject headings are as lows:—Population: numbers, growth and tribution: Housing; Sexes, Ages and rital Condition; Occupations and Indus- s; Birthplace and Nationality; Depend- y, Orphanhood and Fertility; Welsh nguage; Workplaces—in relation to dence.

Housing accommodation is discussed from ious points of view. Attention is called to fact that, notwithstanding the house rtage, the total number of rooms available habitation is greater in relation to the ulation than it was in 1911. At the same e, families are, on the whole, smaller than y were ten years ago, and since small nilies are able to command a higher ndard of housing than the larger, they have orbed a greater share of the available house m than they had in 1911. It is largely to s change and to the uneven distribution of ommodation throughout the country that present situation is due. The proportion of ulation living under the overcrowded ditions of more than two persons per room increased from 9.1 per cent. in 1911 to per cent. in 1921 for the country at large; Northumberland and Durham, however, as ch as 30 per cent. of the population are ced in the overcrowded category, while in ndon the proportion is as high as 16 per t.

NEW BUILDINGS IN LONDON

Croydon.—Exchange.—On a site at Addiscombe, H.M.O.W. are about to erect a new telephone exchange. Tenders are now being invited.

Fulham.—Exchange.—H.M.O.W. are inviting tenders for the erection of a telephone exchange in Fulham.

Goodmayes.—The Trustees of the Congregational Church have signed a contract with Messrs. H. Knight & Sons, 16, Bruce-grove, Tottenham, N., for a new church, to be erected from the designs of Messrs. George Baines & Son, FF.R.I.B.A., A.I.Struct.E., architects, 121, Victoria-street, S.W.1.

Gray's Inn-road.—Clinic.—A new medical clinic, which is estimated to cost £300,000, is to be constructed next to the Royal Free Hospital in Gray's Inn-road, W.C.1.

Hendon.—Library.—The Urban District Council has approved plans for the erection of a new library in Central Hendon, estimated to cost £17,000.

Lewisham.—Conversion.—The Hippodrome, Lewisham, is to be converted into a cinema.

Marylebone Road.—Extensions.—The committee of the Queen Charlotte's Hospital are appealing for £250,000 for various extension works. A new block of buildings adjacent to the existing hospital, containing special wards, is to be erected. An isolation flat of 25 beds, for puerperal fever cases, is to be provided, together with modern wards, fully equipped, for another 75 beds; single private rooms, and completely equipped pathological laboratories.

Stepney.—School.—The London County Council are about to erect an open-air school for tuberculous children in Stepney-green.

Tooting.—Premises.—A commencement has been made on the new drapery and footwear departments, Upper Tooting-road, S.W., for the Royal Arsenal Co-operative Society, Ltd. Messrs Matt. T. Shaw & Sons, Ltd., are to erect the steelwork; Messrs. Shaws Glazed Brick Co., Ltd., supplying terra-cotta facings. The general building work is by the Society's works department Mr. S. W. Ackroyd, A.R.I.B.A., 148, Powis-street, Woolwich, is the architect.

Westbourne-street. — Premises. — Messrs. C. Rickards, Ltd., have obtained the consent of the Paddington Borough Council to the erection of a building over Westbourne-street-mews, W.2.

West Ham.—Flats.—The West Ham Borough Council are to invite tenders for the building of 270 flats on their Manor-road housing site

Westminster. — Warehouse. — Messrs. Roberson's, Ltd., of 217, Knightsbridge, are building new premises in Rochester-row and Vincent-square, S.W.1, to the designs of their architect, Mr. W. Railton. Messrs. Young & Co., 6, Queen Anne's-gate, Westminster, S.W., are supplying the steel-framed construction for the building.

Woolwich. — Alterations. — Premises in New-road, Woolwich, and George-street, Woolwich, are being altered for the Royal Arsenal Co-operative Society, Ltd. Mr. S. W. Ackroyd, A.R.I.B.A., is the architect.

Walthamstow.—Houses.—The Warner Estate, Ltd., have entered into a contract for the erection of 400 houses on their town planned estate. The builders are the Law Land Building Department, Ltd., Norfolk Street, Strand, W.C.2.

Woolwich.—School.—Messrs. Triggs and Co., builders, of Lambourn Works, Mackay Road, Clapham, have secured the contract for erection of an open-air school, on a site between 66 and 82, Fort Road, Woolwich. The work is for the London County Council.

CLINKER ASPHALT PLANT AT BRIGHTON

On Friday last a large party of municipal engineers, Press representatives and others, at the invitation of Messrs. Millars' Machinery Co., Ltd., paid a visit to the refuse destructor works of the Brighton Corporation, at Hollingdean, for the purpose of inspecting the new clinker asphalt plant which has just been laid down there by the company. The party were conducted around the works by Mr. David Edwards, M.Inst.C.E., F.S.I., the Borough Engineer and Surveyor, who explained that the Brighton Corporation had adopted the method of destruction of refuse by combustion, as being in every respect preferable to any alternative method of disposal, such as dumping. Under the guidance of Mr. Edwards, the whole process of disposal was witnessed by the visitors, from the arrival of the refuse in the wagons to its transformation into asphalt by means of the recently-installed plant. The sequence of operations is briefly as follows: The refuse, which contains a high proportion of paper and metal, is fed to the combustion chamber through holes in the floor of the furnace house. The metal constituents are afterwards separated and compressed into rectangular cakes, each weighing about half-a-hundredweight, in which form they are sold at a present price of about 18s. a ton. The clinker is then conveyed to the crushing and mixing plant, and finally made into asphalt.

The lay-out of the plant, consisting of Millars' standard units, was designed to meet the requirements of the City Engineer and Surveyor to deal with clinker having a very high percentage of metal, such as iron nails and strips, broken domestic utensils, tins, etc. Much of this metal content is only partially fused when passing through the destructor and is difficult to extract. The clinker is delivered in large pieces to the plant. The whole equipment of the plant falls into two sections: (a) Crushing, separating, screening, grading and storage section; (b) a drying, heating and mixing section for the manufacture of asphalt from the prepared clinker. The whole plant is conveniently arranged so that the hot asphalt can be delivered directly into lorries standing on the road in the destructor works, while at the same time the screened and graded raw material can be loaded into lorries standing on the higher road on the opposite side of the plant.

The separating of the iron from the crushed clinker in the crushing and grading section of the plant, owing to the high percentage of iron in the clinker, required special treatment. To ensure the highest possible efficiency two separators are fitted, one at the feed inlet of the screen and one at the discharge from the screen to deal with the rejects. The magnetic separator is operated by a special controller, and takes out approximately 70 per cent. of the iron from the clinker.

The second section of the plant for drying, heating and mixing the graded clinker embraces a standard drying, heating and mixing plant mounted at such a height as to discharge directly into lorries standing on the road.

Each of the two sections of the whole plant is arranged for independent driving. The crushing and grading section being driven by a 45 b.h.p. steam engine, while the drying, heating and asphalt section of the plant is driven by a 25 b.h.p. engine.

Following the inspection of the plant, luncheon was taken at the Old Ship Hotel, after which there were some short speeches. Mr. James White, LL.D., chairman of Millars' Machinery Co., Ltd., proposed the toast of "The Corporation of Brighton," and the Mayor, Councillor R. Major, replied.

Mr. David Edwards, called upon for a speech, said that the Brighton Corporation, in their clinker asphalt plant at the destructor works, had an asset of real value. He estimated that with it he could carry out road works at half the cost of operations at contract price.

TRADE NEWS

The Carlton Theatre.

In connection with the description of this building given in our last issue, Mr. Frank T. Verity, F.R.I.B.A., architect, we are informed that Messrs. Allensor, Ltd., were the sub-contractors for the joinery, including that for the stage.

Second-hand Scientific Apparatus.

The April catalogue of Messrs. C. Baker, of 244, High Holborn, W.C., contains details of a wide selection of good and reliable second-hand surveying and other instruments. Messrs. Baker have several first-class theodolites on hand at present, together with sets of drawing instruments, to be sold at advantageous prices. They have also an extensive collection of levels, mining dials, circumferentors, etc. The catalogue will be sent gladly upon request.

Modern Building Construction.

Under this heading, an interesting booklet has been produced by the Triangular Construction Co., Ltd., of East Molesey, Surrey. This firm's system of building contruction deals with the use of concrete, and, we are given to understand, eliminates the many disadvantages of the wet systems of building with shuttering. It permits of making, on the actual building site, building units of standard sizes and shapes which, it is claimed, produce a far more adaptable system of building than is possible with bricks, masonry or wet concrete.

Terra-cotta Faience.

Messrs. J. Lyons and Co., Ltd., are proceeding immediately with the erection of another large restaurant in London. This is to be built on the site of the old Oxford Theatre of Varieties, and the contract for the faience for the main facades, amounting to more than £10,000, has been placed with the Leeds Fireclay Co., Ltd. The material to be used is similar to that recently supplied by the same firm for the Park Lane Hotel, Piccadilly.

An Interesting Jubilee.

On May 1 Mr. Cornelius Koning, of Amsterdam, celebrated his jubilee as agent in Holland for the North British Rubber Co., Ltd. Although Mr. Koning has handled the whole range of "North British" products, he has done pioneer work in the introduction of rubber flooring into Holland. Within six months of the invention and manufacture of "Paraflor" rubber carpeting by the North British Rubber Co., he had sold quantities of this material to the value of £10,000. The directors of the North British Rubber Co., at their board meeting on Wednesday, April 27, passed a special minute of congratulation and appreciation, and in forwarding copy of this minute to Mr. Koning, accompanied it with a gold cigar case, suitably inscribed.

Gaze's Co-Partners' Dinner.

Messrs. W. H. Gaze and Sons, Ltd., gave a dinner to their employee shareholders on April 23, at the "Griffin" Hotel, at Kingston-on-Thames. Mr. W. H. Gaze, by whom the firm was founded in 1885, in proposing the toast of "Our Co-Partners," remarked that it was very gratifying to see so many co-partners present. In explaining how the co-partnership came about, he said that in the year 1909, the directors seriously considered the advisability of forming their then business into a limited liability company, with a co-partnership scheme of employees' shares, so that their staff should share with them such profits as they hoped to make. In the following year, 1910, they gave birth to this company, and had gone on year by year until they had built up the business they had to-day, which was a very successful undertaking. In the first year, 1910, they numbered about 5,637 co-partnership shares: to-day they were 191,000. During dinner the company was entertained with musical items, and later with a most enjoyable concert party.

PROPOSED NEW BUILDINGS & OTHER WORKS*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education; M.A.B. for Metropolitan Asylums Board; and M.W.B. for Metropolitan Water Board.

LIVERPOOL.—Damage estmated at £15,000 wa caused by fire in Forth-street.

*See also our List of Contracts, Competitions, etc.

ESTIMATING ON RIGHT LINES

Everyone whose business it is to quote for building work should master the principles upon which estimating is based. These principles are clearly explained and illustrated in

'HOW TO ESTIMATE'

by J. T. REA,

a unique and invaluable work which is not excelled in thoroughness or in scope by any similar book known.

Fourth edition (now ready). 540 pages. Price 15s. net (by post 15s. 9d.). Containing thousands of prices and hundreds of examples of analysis, showing how a builder can make up rates for himself. In view of the difficulty of fixing standard prices under present conditions, the author has included an important series of Adaptation Tables and Percentages (corrected to February, 1927), *which show how rates may be adjusted to meet variations at any time.*

Before purchasing any other book on this vitally important subject, you are invited to inspect this—the standard work which is in use by over 30,000 builders.

A COPY WILL BE SENT BY RETURN, AND YOUR REMITTANCE REFUNDED IF THE BOOK DOES NOT SATISFY YOUR REQUIREMENTS.

TRANSPORT AND HOUSING IN LONDON

The following statement has been issued by the Council of the Garden Cities and Town-Planning Association dealing with the proposed Government contribution towards the improvement of the London bridges:—

"Why are the bridge improvements wanted? Because of the vast increase in London's internal traffic. London is still spreading in all directions as a solid unbroken urban mass. Its suburbs are added in continuous rings. Its central buildings are getting loftier and more crowded. Longer and longer daily journeys and increasing discomforts are forced upon its working population. All this is universally deplored. The cost is mounting. The inconveniences to London industry are becoming intolerable. The waste of time and loss of leisure is appalling. The divorce of the people still living in the centre from playing-fields and the life of the country is more and more complete and disastrous.

"It is urgently necessary that a new policy shall be devised—a policy of decentralization of industry and commerce into properly planned and organised towns on the Letchworth and Welwyn model, and a housing policy which will relieve instead of intensify internal traffic. We desire to point out, therefore, that if decentralisation of industry, as best carried out in garden cities, had been adopted during the last decade, many of the transport problems would not to-day have arisen. Further, if this policy is adopted for the future, very considerable relief will be given to the problems of congestion, housing, and transport in London. The money which it is proposed should be spent on the improvement of cross-river traffic is a palliative and not a cure, and if the policy advocated by the Association is not scientifically pursued, more money still will have to be spent on the development of London, and the expenditure under this heading will be constantly recurring."

THE SCOTTISH BUILDE

NEW BUILDINGS IN SCOTLAND

Glasgow.—Houses.—The Dean of Guild Court has granted a lining for the erection of houses at Fingask-street, Shettleston, for the Corporation, and Messrs. John Adam & Co., Crossmyloof, for twelve terraced houses and two villas at Kilangowan-road and Mannering-road; and the Corporation Electricity Department were also given permission to erect a sub-station at Kirk-street, Calton.

Dunfermline.—Church.—The Dunfermline Presbytery have approved plans for a new church at Rosyth to accommodate 440 people, and the estimated cost is £6,200.

Rothesay.—Bandstand.—A special Committee of the Town Council is further considering the question of the erection of a bandstand for the Royal Rothesay Silver Band.

Edinburgh.—Improvements.—The Dean of Guild Court has granted warrant for the erection of five bungalows at Boswell-crescent, Wardie; two houses at Denham Green-terrace; and for alterations at the Empire Palace Theatre for the Moss Empires, Ltd.

Falkirk.—Garage.—Mr. D. Haston, of Cow Wynd, has been granted a warrant by the Dean of Guild Court to erect a large garage on the main Glasgow-Edinburgh road, near Belmont Lodge.

Glasgow.—Houses.—The Corporation has approved the housing schemes which are estimated to cost over £1,000,000. One of the schemes provides for the erection of 1,000 houses of a patent system of construction, with a large proportion of the houses having flat roofs. The preparation of a housing site at High Carntyne, on the new Glasgow-Edinburgh-road, was authorised.

Nairn.—Houses.—In connection with the housing scheme, another four blocks of four houses each are to be erected at Lochloy-road, at an estimated cost of £1,204.

Clarkston. — Offices. — The Renfrewshire Standing Joint Committee are considering the question of building a police office Clarkston.

Dundee.—Buildings.—Following propo new buildings, etc., have been lodged at Office of the City Engineer:—Barrack-roa Maternity Hospital for Directors of Dur Royal Infirmary, architects, Messrs. John & Baxter, 31, Albert-square; Gilburn-roa sub-station for the Corporation Electri Department; High-street and Gibb's-l Lochee—school for the Rt. Rev. Bis Toner, architects, Messrs. Allan & Fris 26, Castle-street; Speed-street—sub-sta for the Corporation.

Tranent.—School.—New infants' sc is to be built at a cost of £15,474.

Dunbar.—Additions.—A sum of £6,81 to be spent on additions to the Second School.

Dundee.—Factory.—A new linol factory is to be erected in Clepington-r The promoters of the scheme are the N British Linoleum Co.

Glasgow. — Extension. — The Glas Parish Council has approved the estim for the erection of a medico-electrical dep ment at Stobhill Hospital at a cost of £20,400.

Dundee.—Extension.—Extensions to verandahs of Westgreen Hospital, which estimated to cost £1,300, have been agr by the House Committee of Dundee Dist Board of Control.

Epstein's Bust of Mr. MacDonald.

The Glasgow Corporation have un mously decided to purchase the Epstein of Mr. MacDonald for £200. The bust now on view in the Kelvingrove Art leries.

Obituary.

The death has occurred at his home, Cottage, Callander, of Mr. James Fergu master builder. Mr. Ferguson was 63 y of age.
